# Early history of the Earth and origin of life(35+15+10m.)

S. Maruyama (Earth & Life Science Institute, Tokyo tech., Japan)

1. Early history of the Earth: A summary
2. Research for the origin of life : Complexity science  
The issue cannot be solved by only biologists  
→ **Our strategy** is to reveal “the cradle of life (Hadean Earth environment)” and physical necessity of environmental fluctuation
3. What is life : Definition and requirements to emerge life
4. Combine our results with genome science and experiments of prebiotic chemical evolution
5. Introduction of **3-step model to create life**
6. **Next strategy:**
  - ① Laboratory experiments (nuclear reactor, toxic ocean etc)
  - ② Numerical simulation of prebiotic chemical evolution
  - ③ Falsifiability + Upgrading of working hypothesis→ We will be able to reach the truth

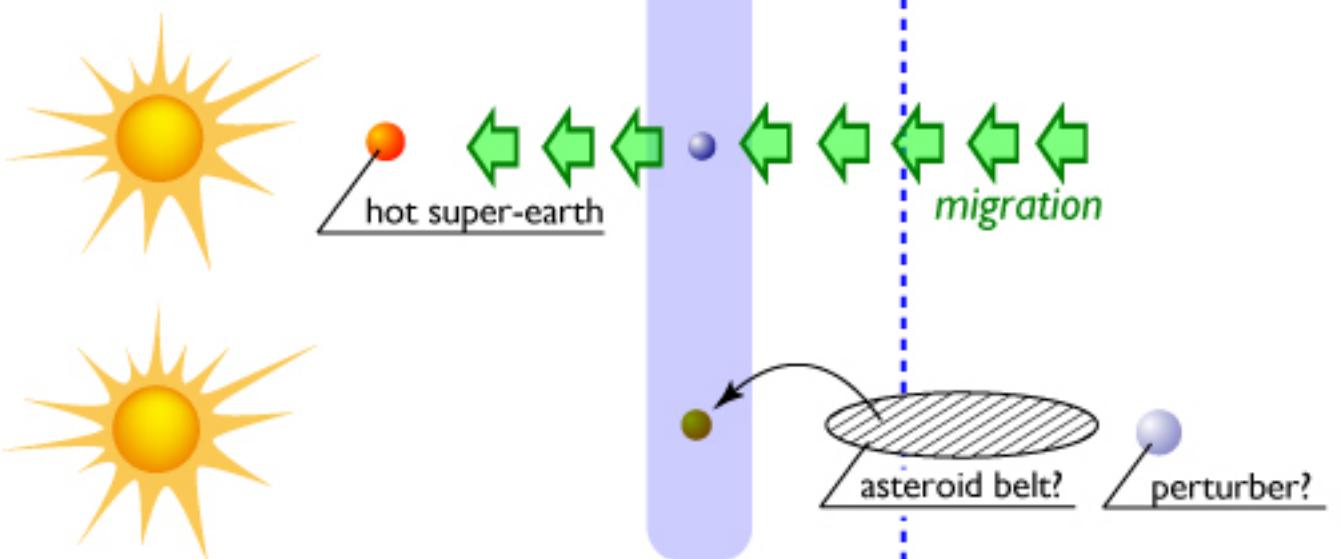

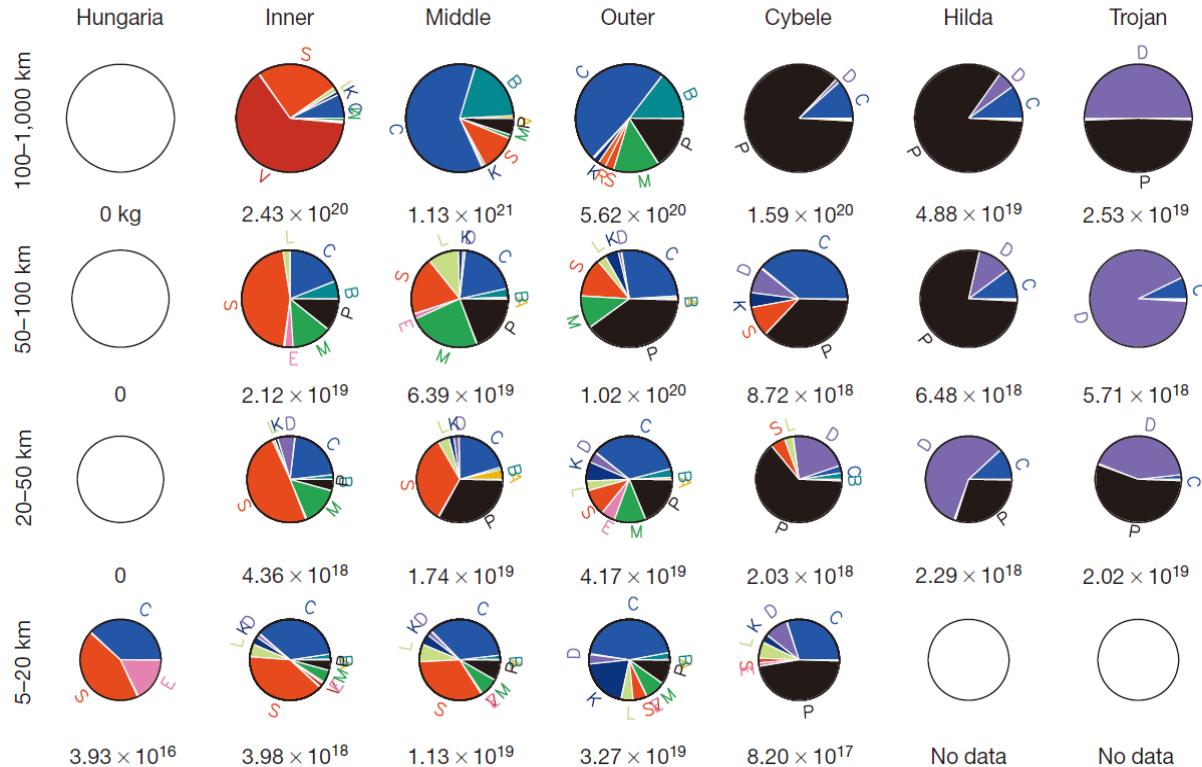

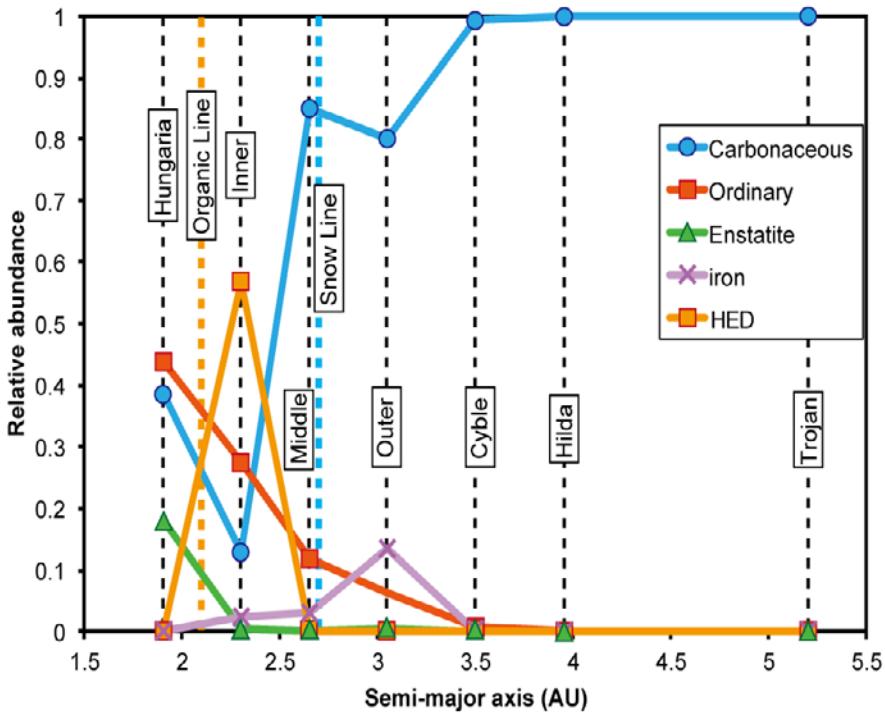

Fig.16

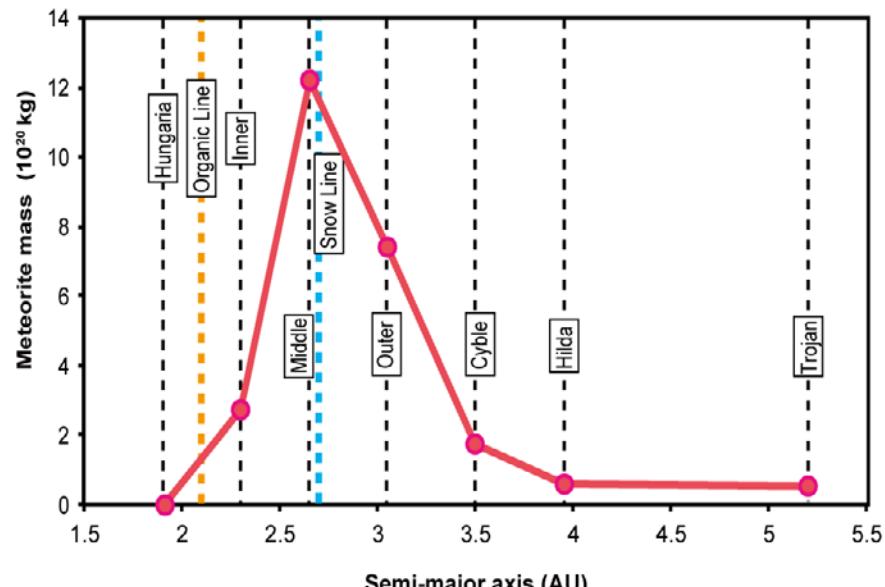

**Figure 4 | The compositional mass distribution as a function of size throughout the main belt out to the Trojans.** The mass is calculated for each individual object with a diameter of 50 km and greater, using its albedo to determine size and the average density<sup>39</sup> for that asteroid's taxonomic class. For the smaller sizes we determine the fractional contribution of each class at each size and semi-major axis, and then apply that fraction to the distribution of all known asteroids from the Minor Planet Center (<http://minorplanetcenter.org/>) including a correction for discovery incompleteness at the smallest sizes in the

middle and outer belt<sup>19</sup>. Asteroid mass is grouped according to objects within four size ranges, with diameters of 100–1,000 km, 50–100 km, 20–50 km and 5–20 km. Seven zones are defined as in Fig. 1: Hungaria, inner belt, middle belt, outer belt, Cybele, Hilda and Trojan. The total mass of each zone at each size is labelled and the pie charts mark the fractional mass contribution of each unique spectral class of asteroid. The total mass of Hildas and Trojans are underestimated because of discovery incompleteness. The relative contribution of each class changes with both size and distance.

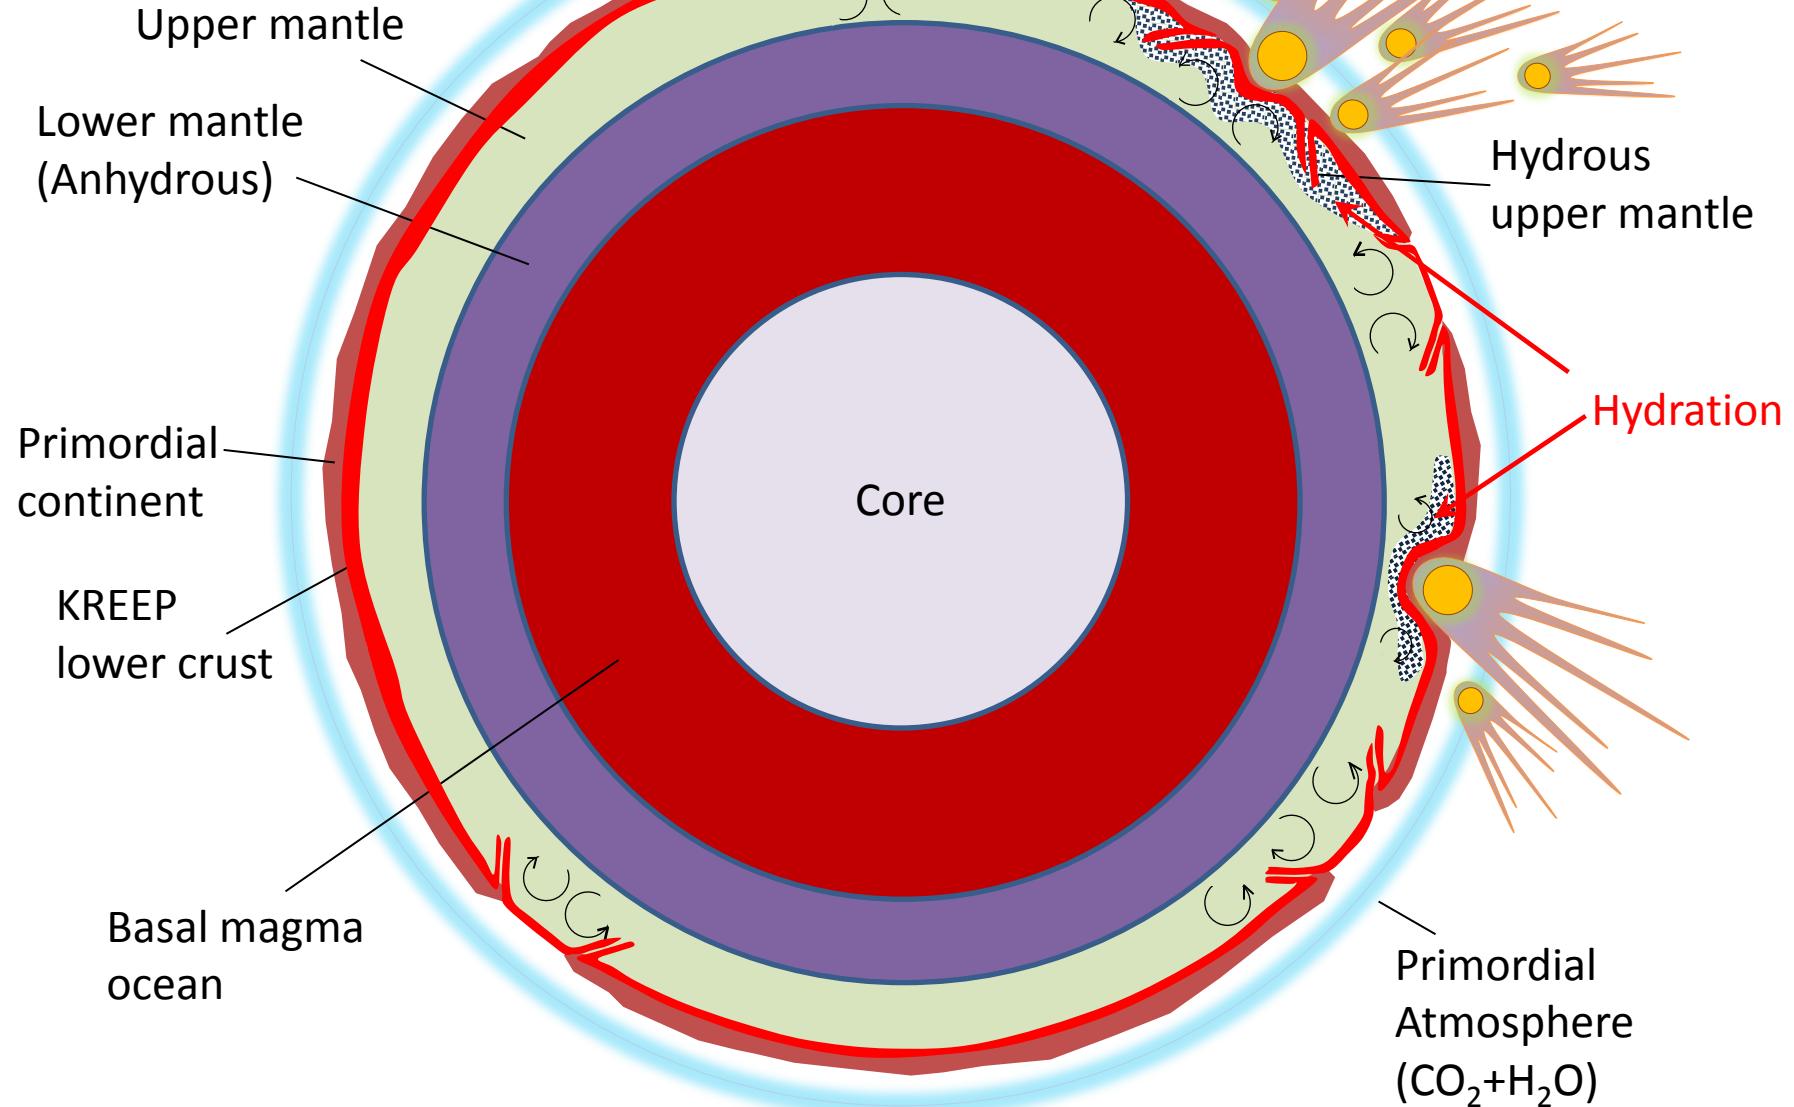

- **Chemical zoning in the asteroid belt**
- Carry, 2010とDeMeo et al., 2012から
- 作成した各小惑星を隕石と対応させて作成した図。
- アステロイドベルト中の各隕石の存在比を示す
- Enstatiteは2.5AUより内側で存在する。
- 炭素質コンドライトは主に2.5AUより外側に存在する。

Organic matter

## 2. Our research strategy for origin of life

- Research for the origin of life is **complexity science**  
The issue cannot be solved by only biologists

→Our strategy is  
to reveal

- 1: “the cradle of life (Hadean Earth environment)”
- 2: physical necessity of environmental fluctuation

生命の起源研究は、生物学者だけでは解決できない複雑系科学

- →その器の研究と環境変動の物理的必然研究が我々の戦略

### 3. What is life?

## Definition and requirements

### 1. Definition

membrane, metabolism, self-replication

### 2. Requirements

① Supply of bio-elements (C,H,O,N)

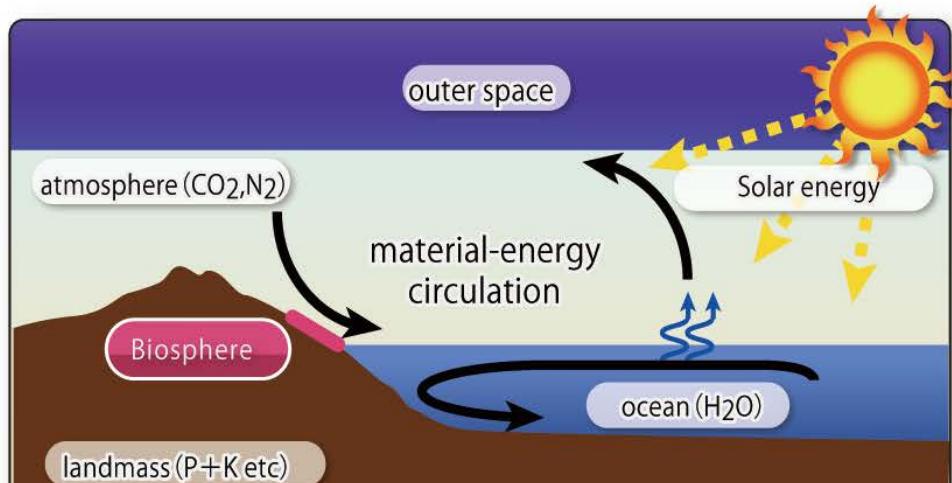

② Non-stop material circulation system driven  
by the energy source (Habitable Trinity)

→ Biosphere is the sub-system to create  
a phenomenon as life

# Habitable Trinity environment

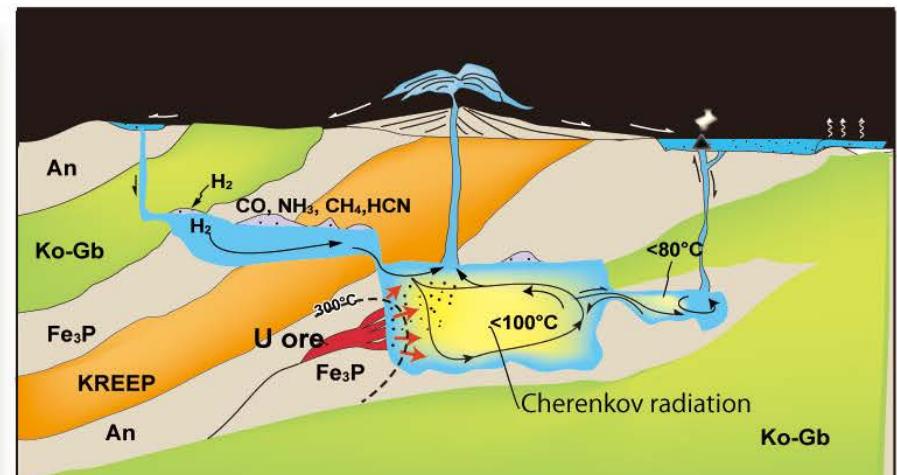

## present day vs Hadean Earth

Life: A phenomenon of biosphere as sub-system on Earth which is driven by the Sun

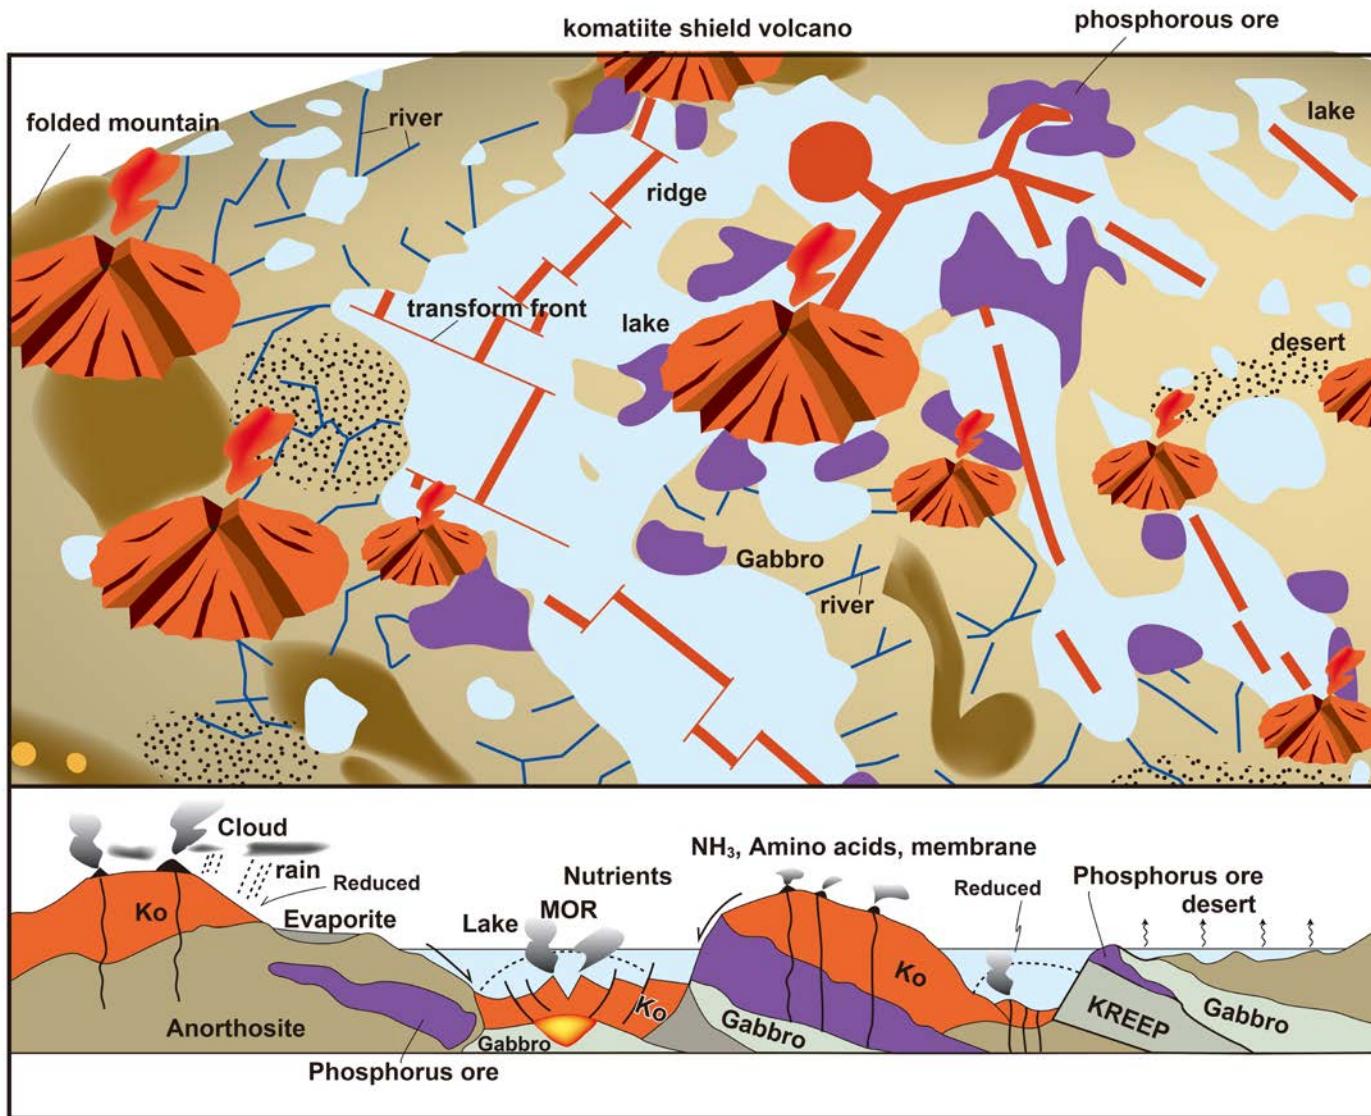

Dohm and Maruyama (2014)  
present day Earth

Hadean Earth: Due to unavailability of the Sun, natural nuclear reactor functioned as "small Sun"

Maruyama (2016)  
Hadean Earth

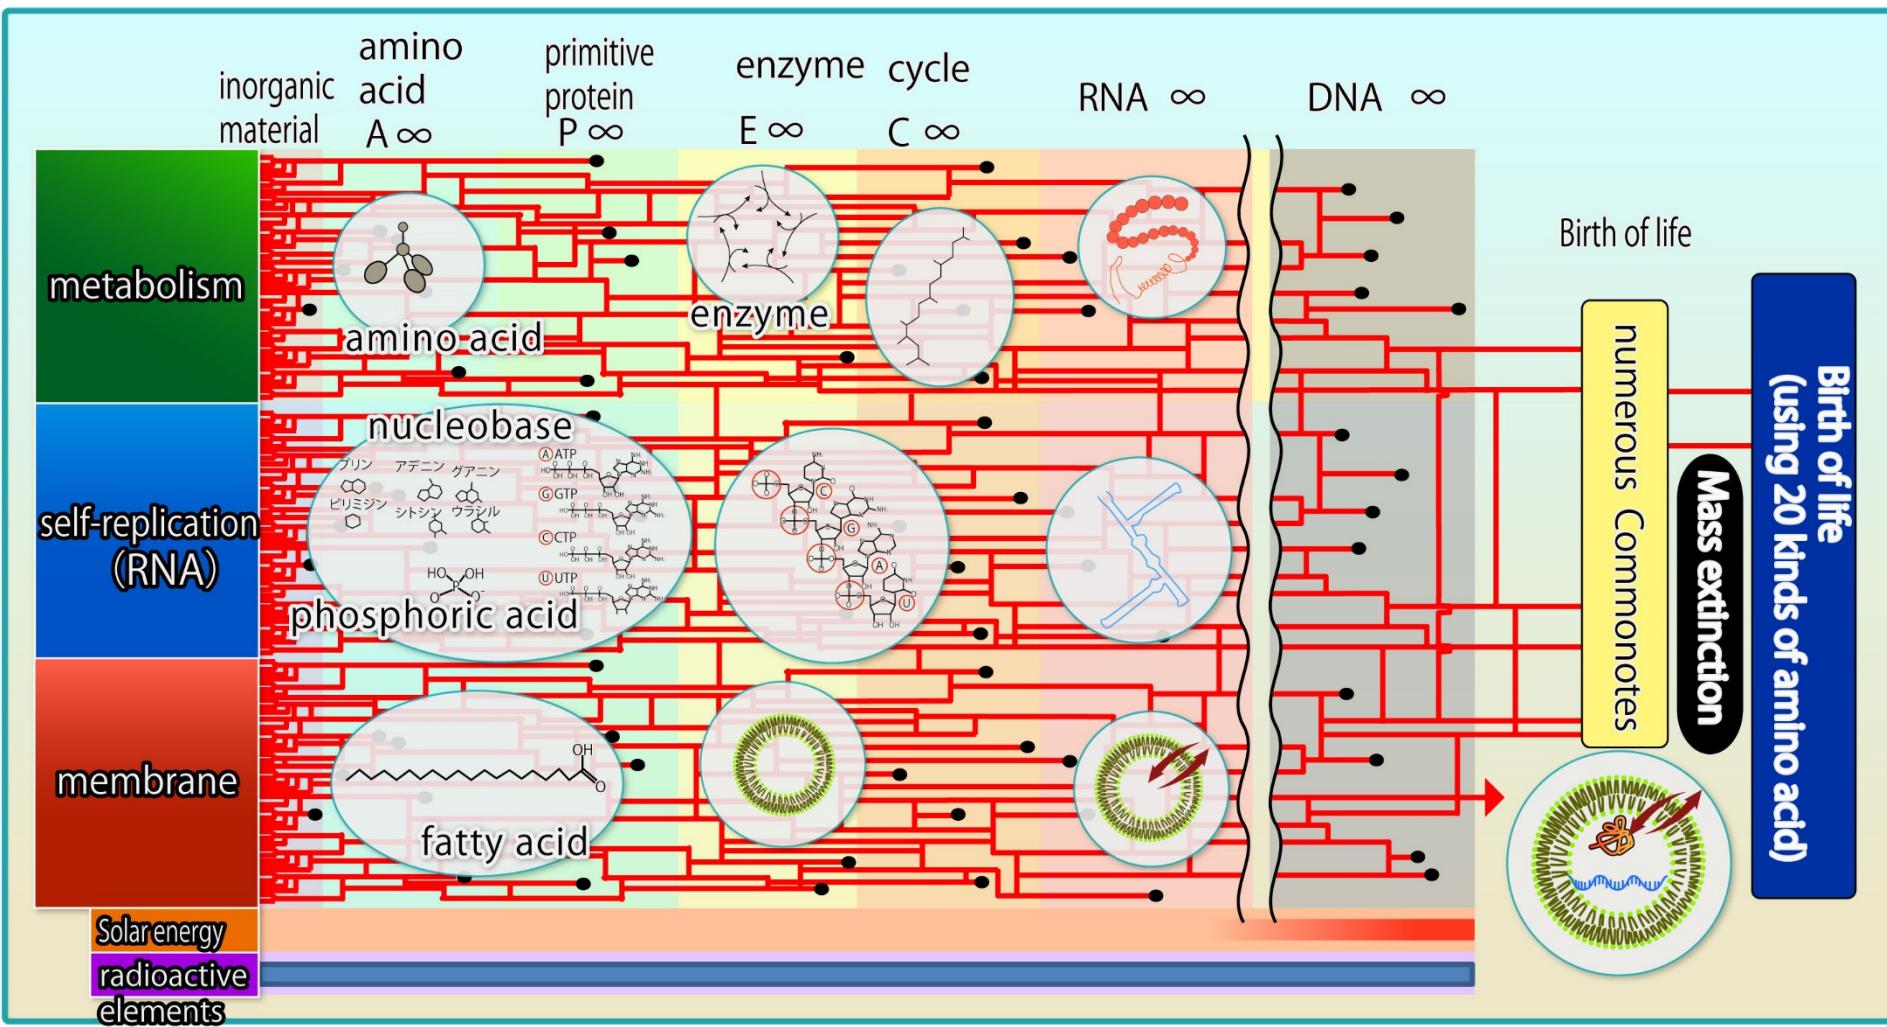

# Huge landmass is necessary on Hadean Earth to provide nice place to bear life

4. Combine our results with  
genome science  
and  
experiments of prebiotic chemical evolution

われわれの研究成果に  
ゲノム科学と前駆的化学進化実験を  
組み合わせる

# Process to the birth of life

## 5. Introduction of **3-step model to create life**

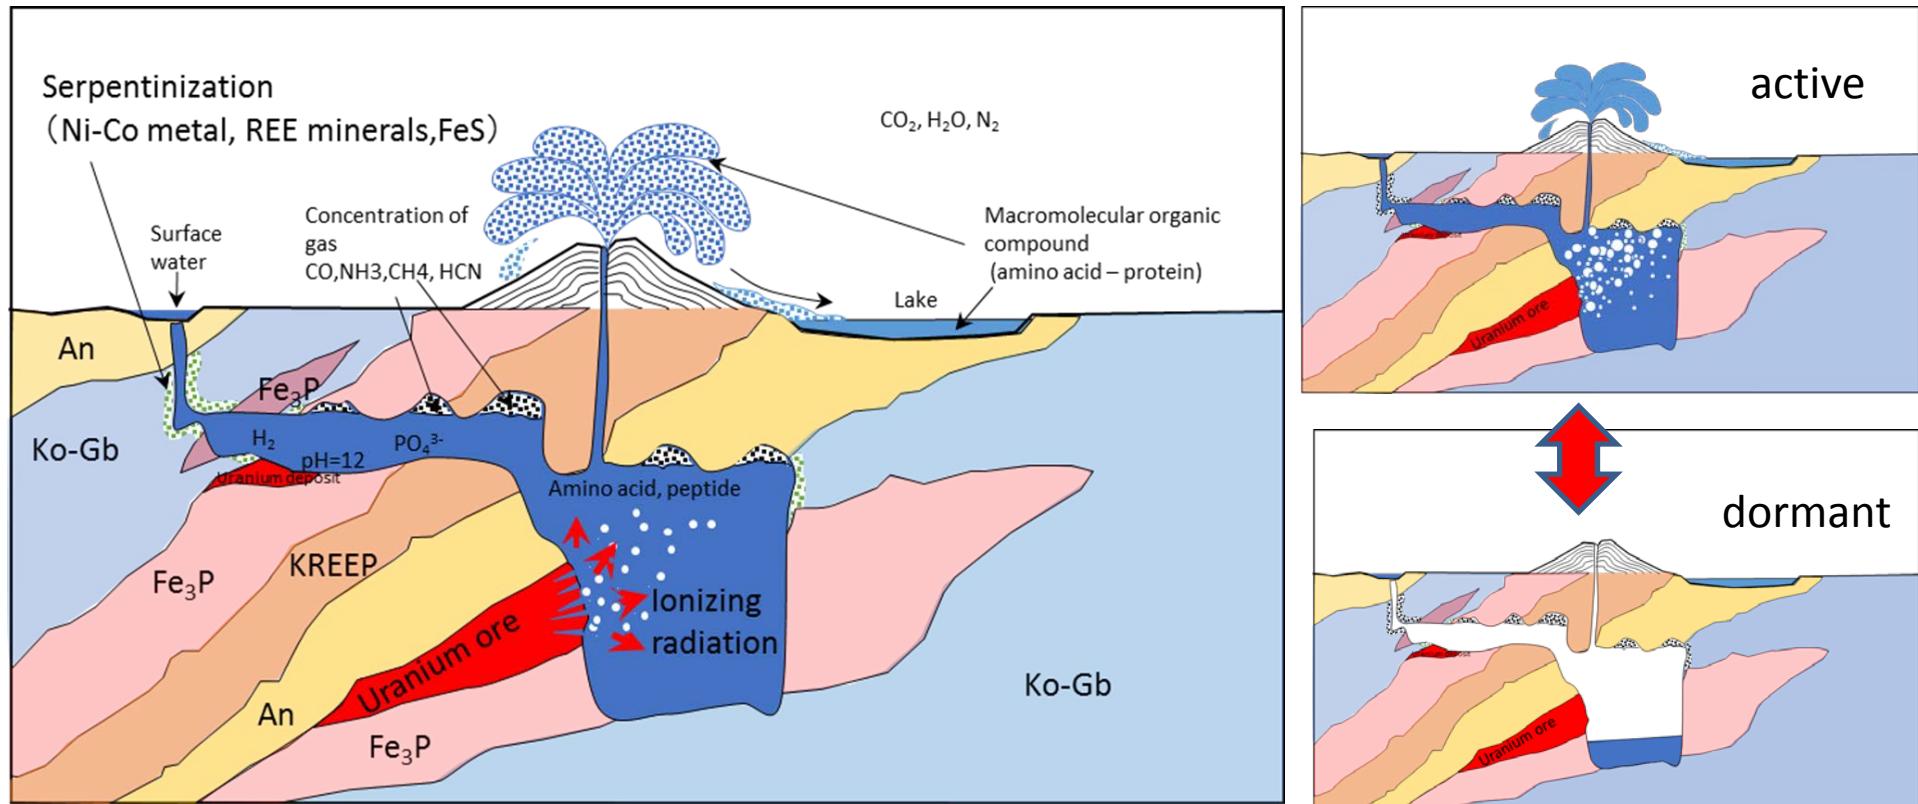

三段階モデルの提案

# Nuclear geyser model

Non-thermal energy (ionizing radiation) is necessary to facilitate the reaction

非熱的エネルギー(電離放射線)源が必要(ただの温泉や中央海嶺では不可)

CO<sub>2</sub>, H<sub>2</sub>O and N<sub>2</sub> are very stable materials thermodynamically on the Earth's surface.

Natural reactor can destroy those into elementary particles in the broad sense, i.e., proton, neutron and numbers of electrons near the reactor, but those were react to form complex Organic compounds away from the reactor.

# Low Radiation level

inorganic

organic

$\text{H}_2\text{O}$

$\text{CO}_2$

$\text{HCHO}$

$\text{HCN}$

*nitriles*  
*(cyanohydrin)*

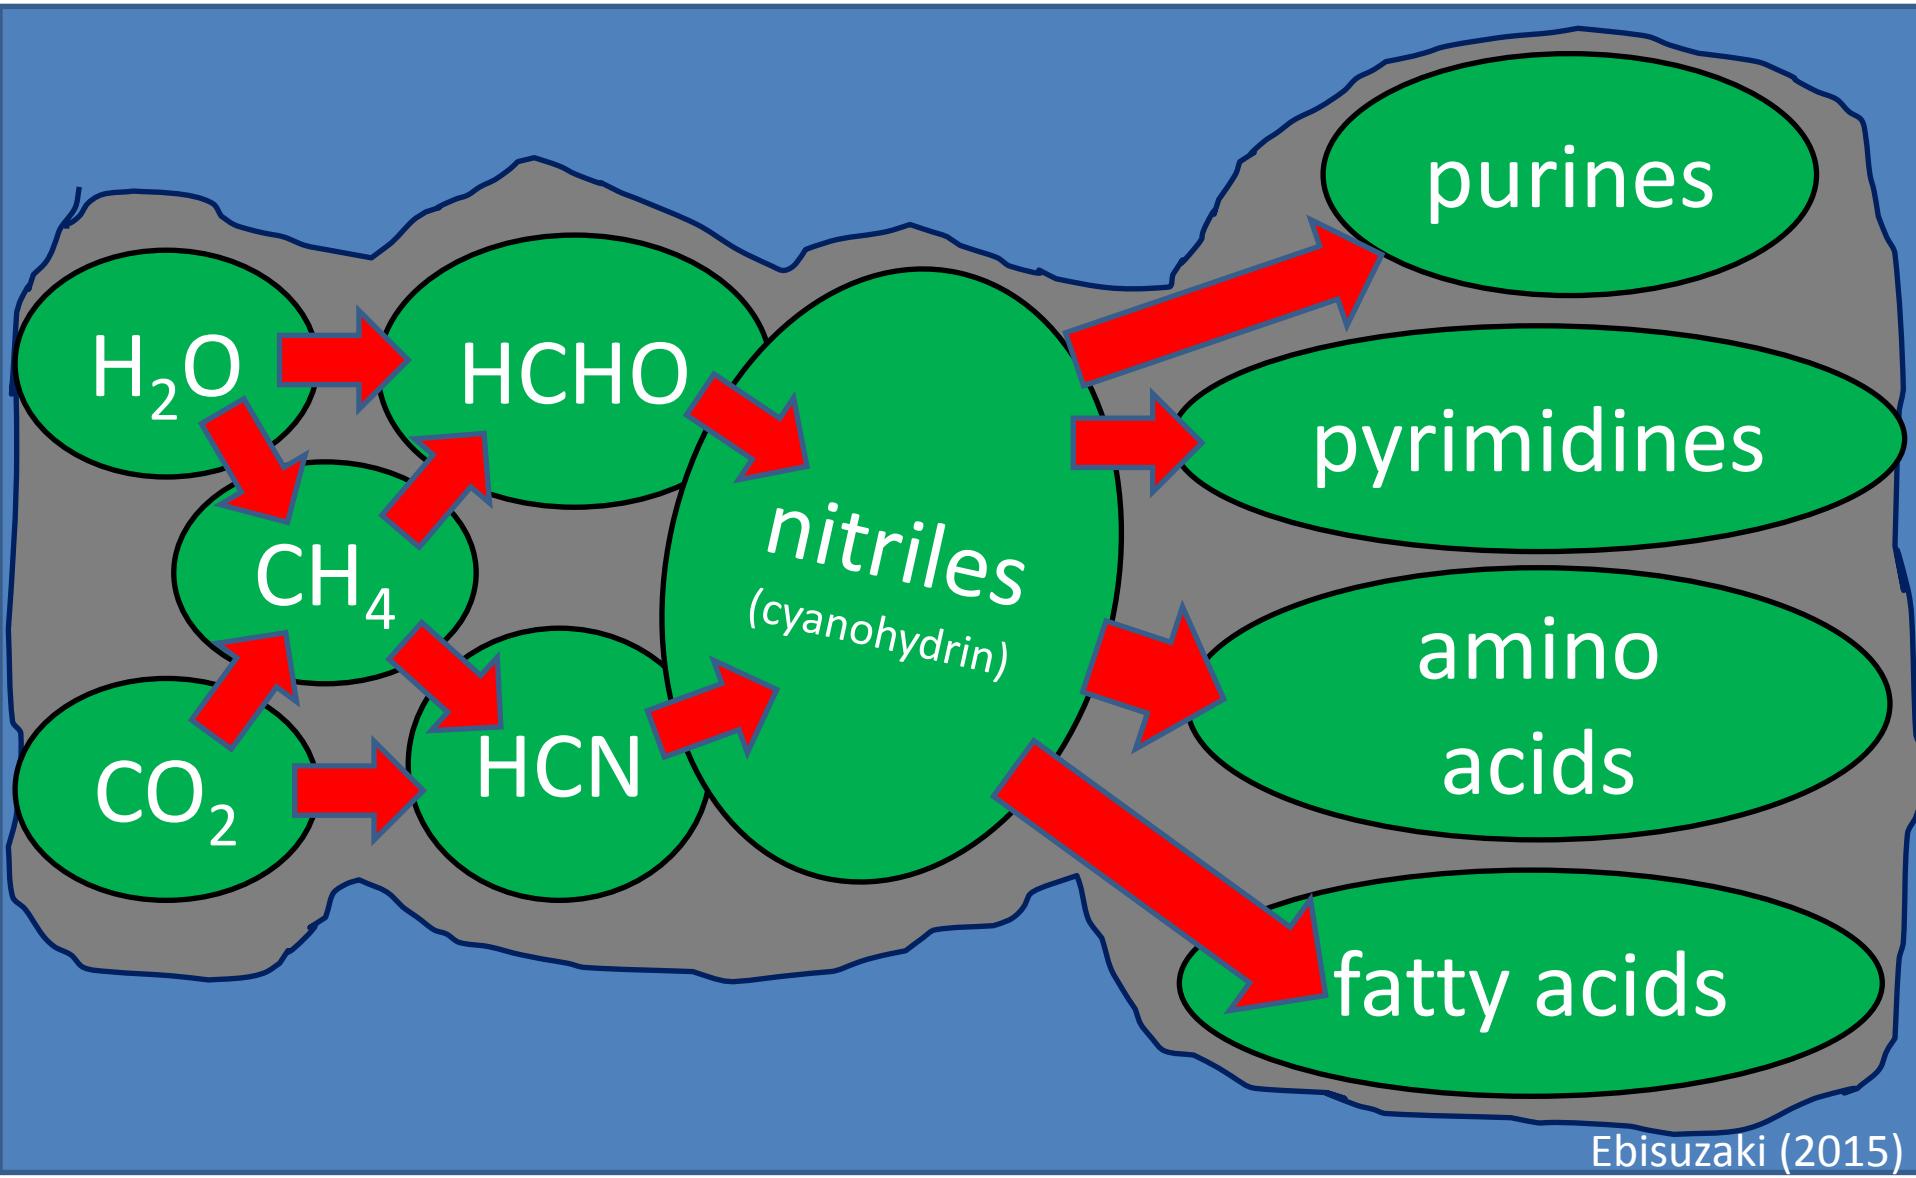

purines

pyrimidines

amino  
acids

fatty acids

# High Radiation level

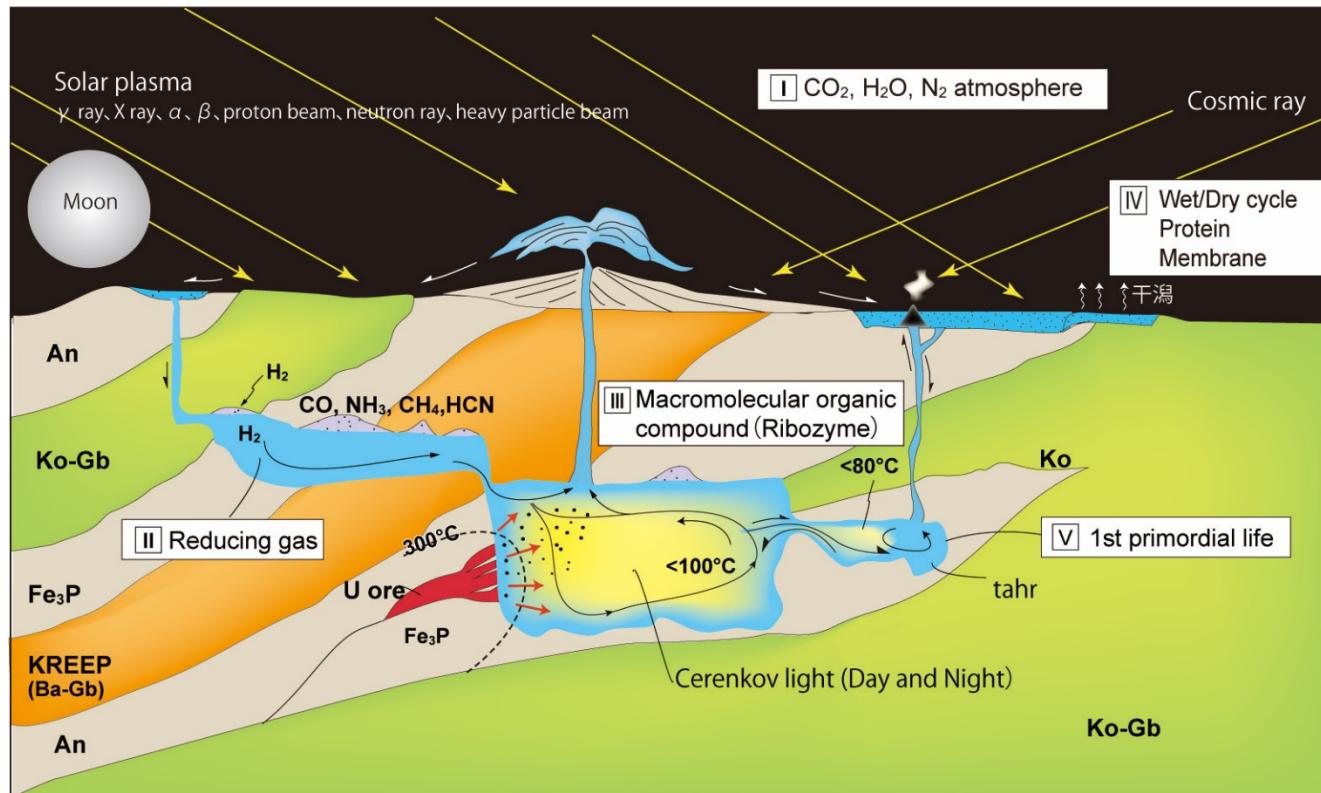

# 3 step model

1<sup>st</sup> primordial life in nuclear geyser

2<sup>nd</sup> primordial life under the Sun

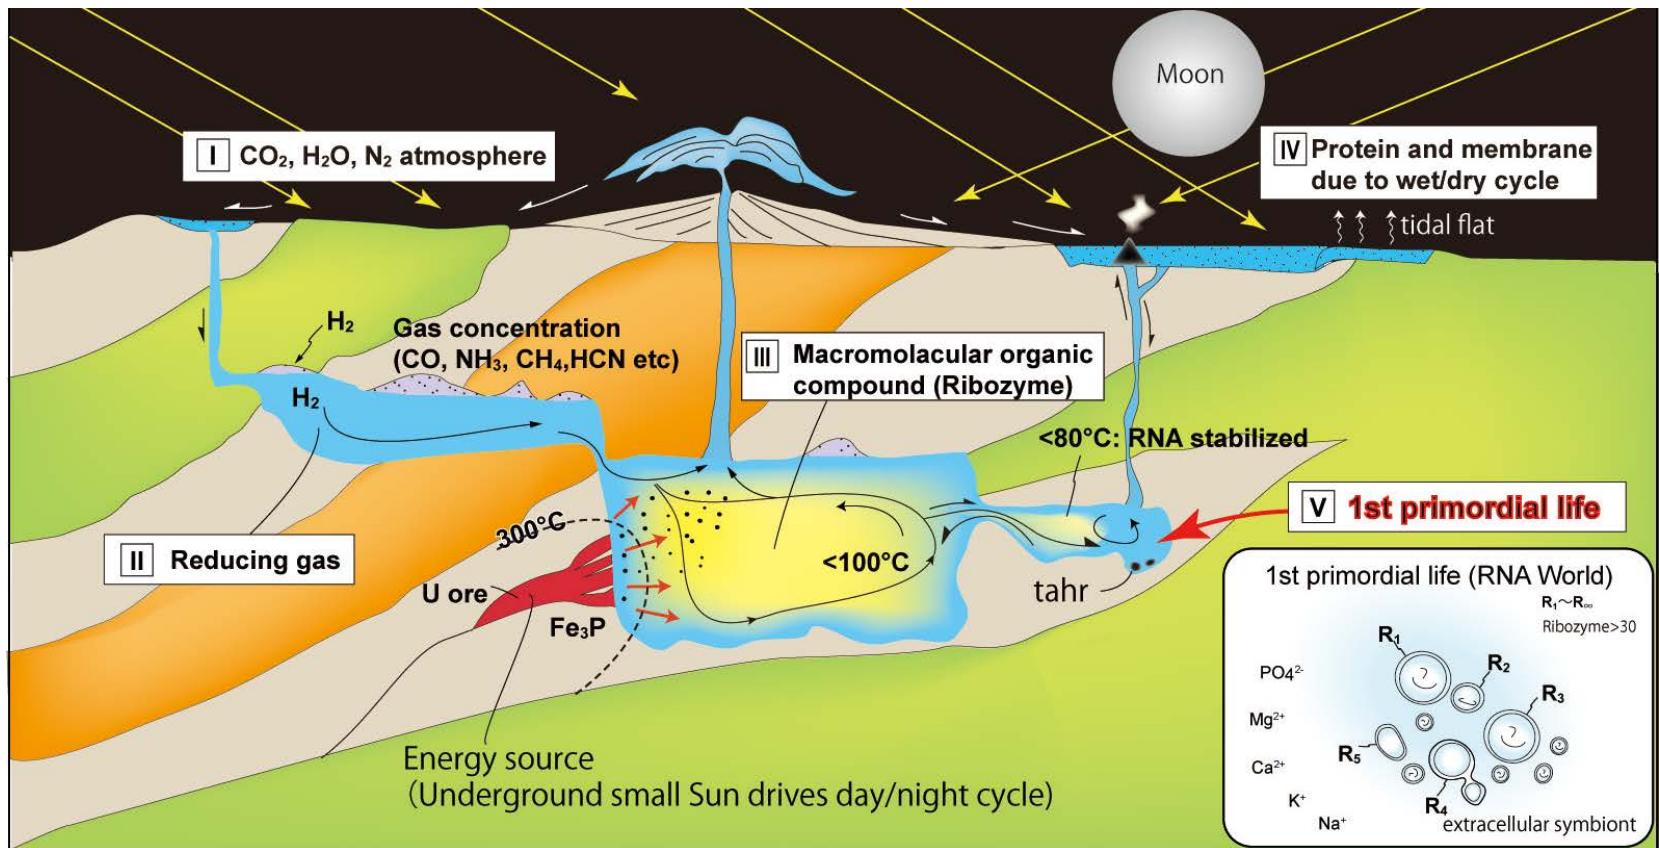

3<sup>rd</sup> primordial life is the first prokaryote

# Material circulation at 4.4Ga between surface environment and geyser

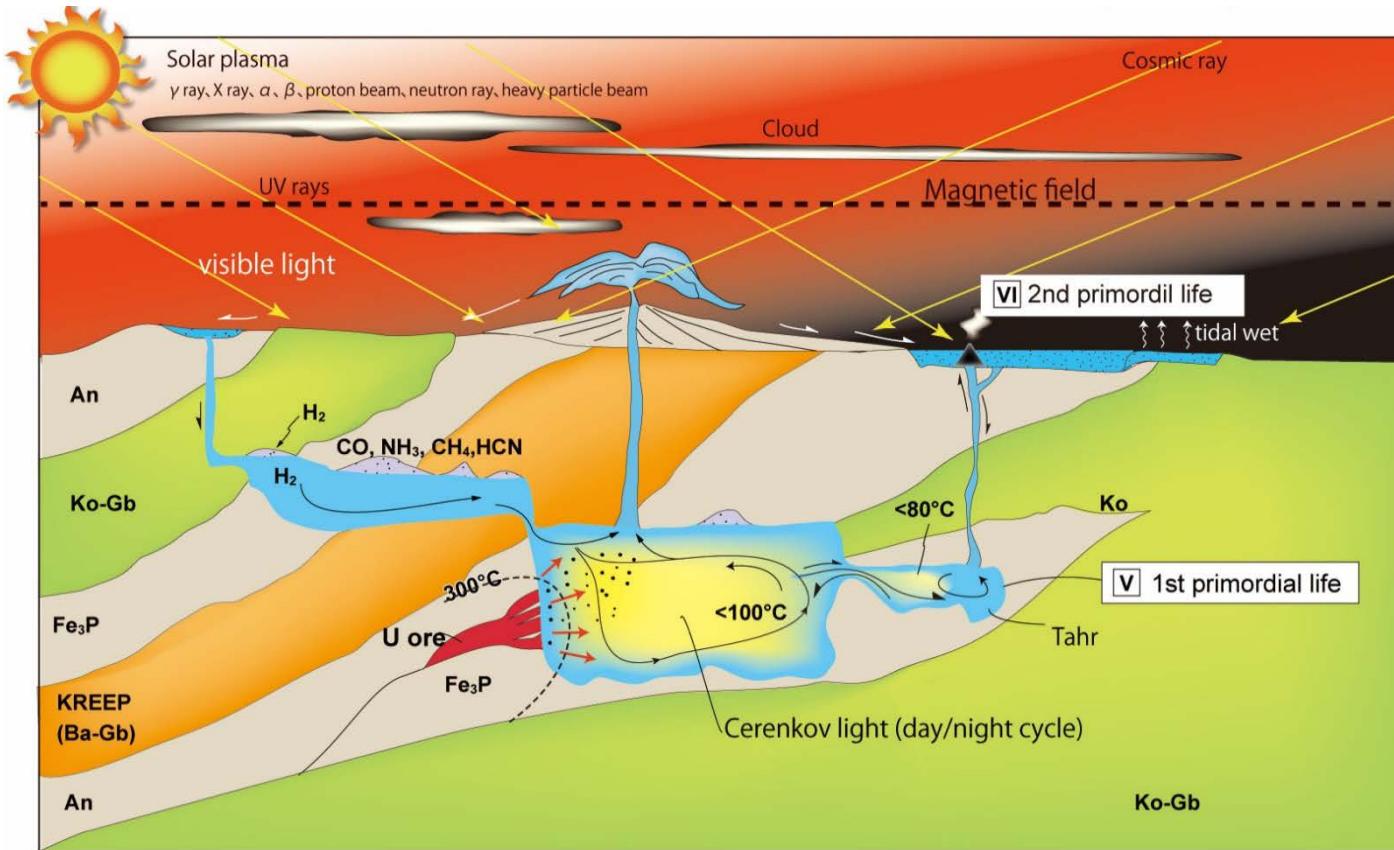

- Reaction of organic materials is accelerated through material circulation between surface environment and inside of geyser.
- Building blocks of life can be produced in geyser main room.
- Due to closer Moon, strong tidal force create wet/dry to polymerize amino acids and membrane by evaporation, those of which are transported to the small room for the birth place of life.

# 1<sup>st</sup> primordial life in nuclear geyser at 4.4Ga

- Necessary 20 ribozymes should have been produced at this stage in this small room (temperature less than 80 °C).
- Primordial life created extracellular symbiont to survive (symbiosis like virus)
- 1<sup>st</sup> primordial life periodically transported to the surface by the geyser to die.

# 2<sup>nd</sup> primordial life under the Sun at 4.3Ga

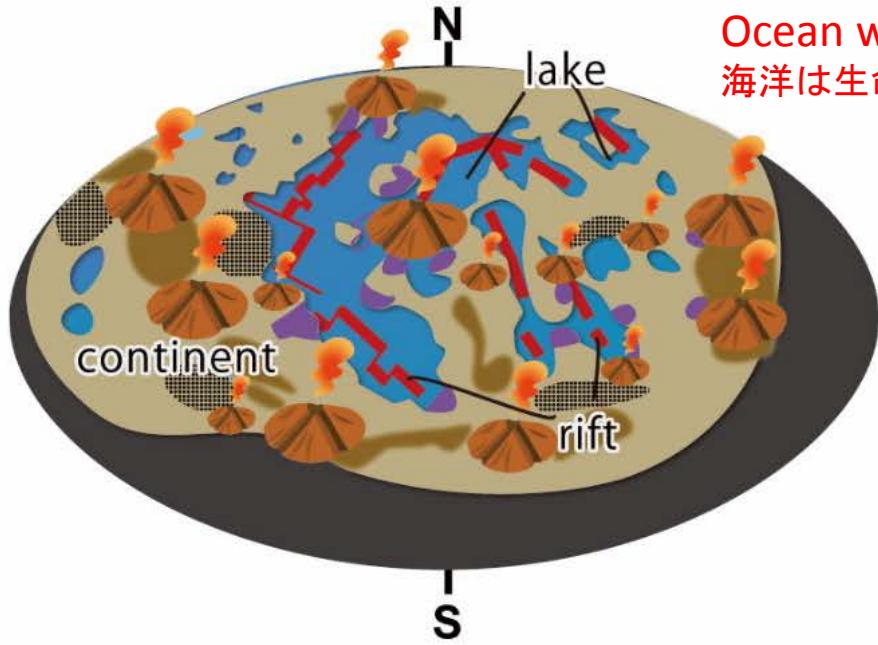

- First stage life was transported to the surface periodically through geyser explosion.
- Transition period from 1<sup>st</sup> primordial life to 2<sup>nd</sup> primordial life which can utilize solar energy by application of principle of semiconductor (electron bank). Night has come to use ATP stock in daytime.
- Still in symbiosis with others.

# Ocean was not mother of life

- 1 Highly toxic ( $\text{pH}<1$ , 5-10 salinity, and high abundance of heavy metals) in nature to be demonstrated by calculation and experiments (heating experiments of CI chondrites: on-going)
- 2 This has been true even ca.600-500Ma for emergence of metazoans (Cambrian explosion)
- 3 Even today, most biomass is around continents because of nutrients supply from landmass; Ocean is desert!

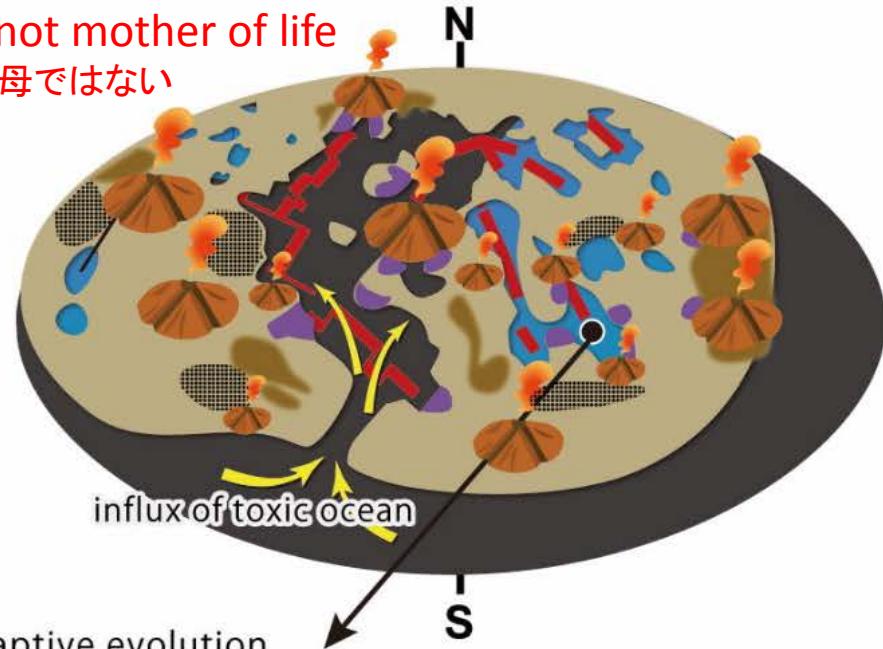

## 4.2Ga Birth of 3rd primordial life (Prokaryote)

2nd primordial life move in rift valley (with non-toxic water) from lucstrine environment

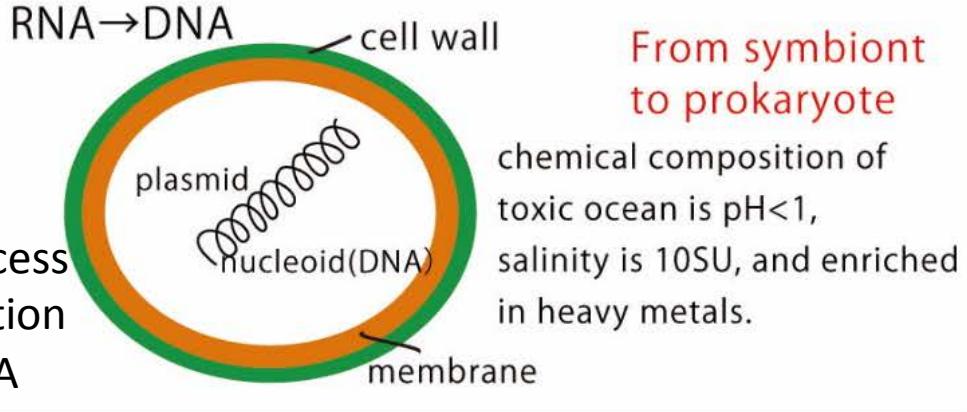

Ocean was not mother of life  
海洋は生命の母ではない

Influx of toxic ocean and mass extinction

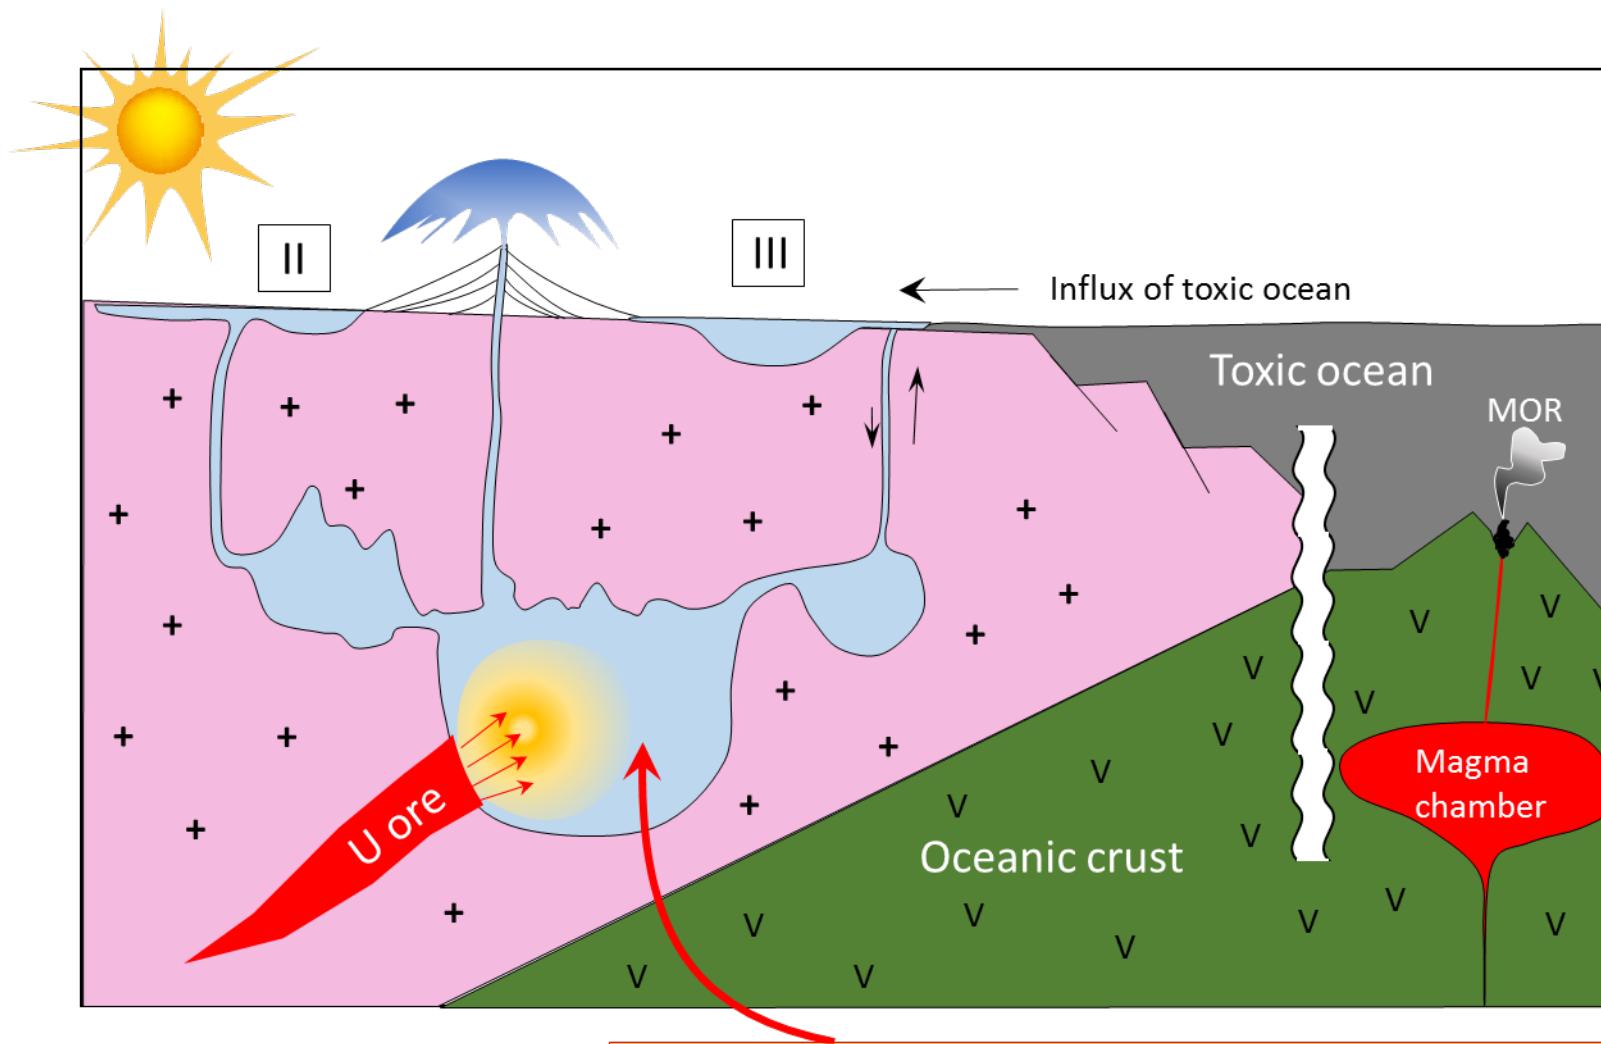

Adaptive evolution

- To prevent from entering toxic elements such as Na inside the cell, Na-pump was invented, as well as cell wall.
- Multiple mass extinction and severe environmental change made a series of process spiral DNA shape and process of self-replication
- Minimum gene ca. 100-200 entered into DNA

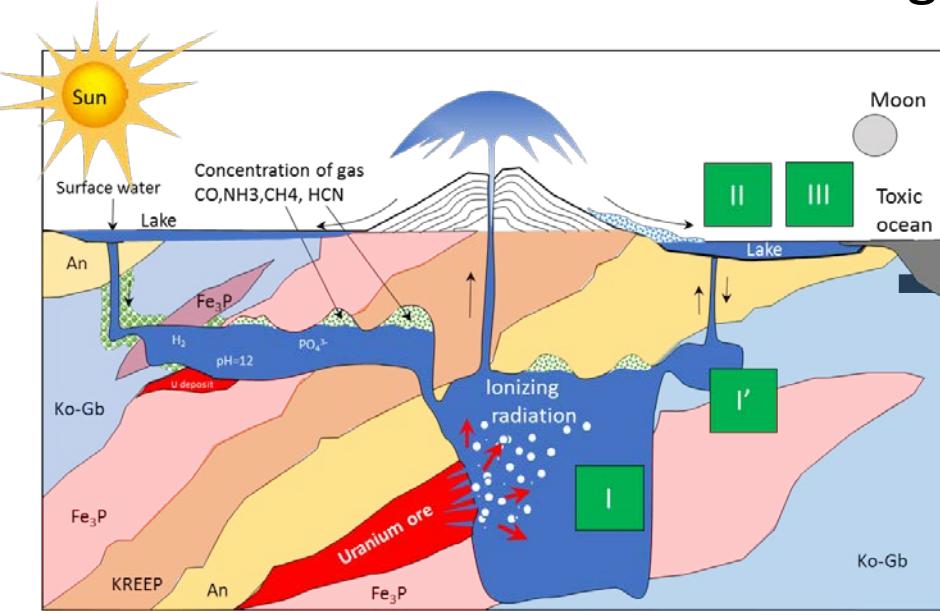

# Circulation/migration of produced organic matters

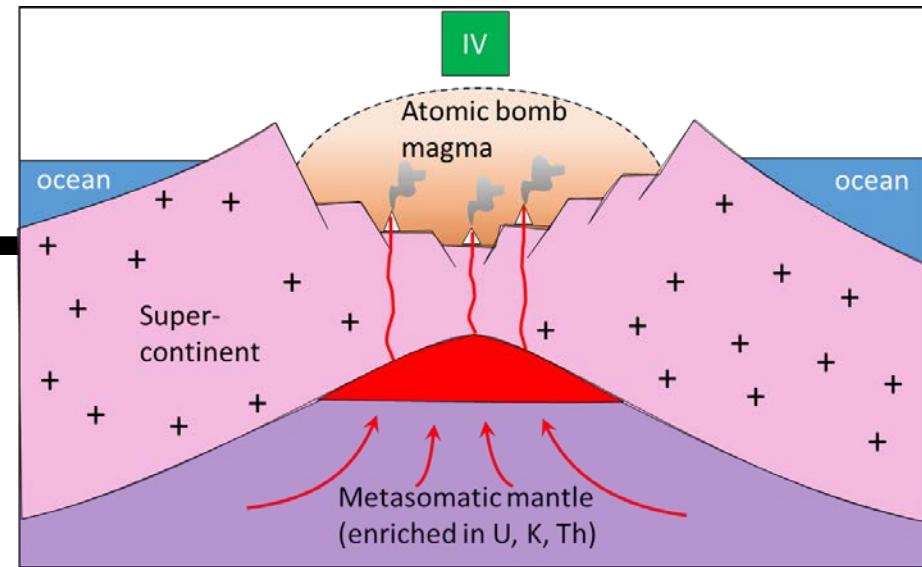

Factory to supply evolved building blocks of life

# Change of Factory from I, through II and III, and finally to IV for building blocks of life

Hadean – Archean Earth

Earth since 2.0Ga

- Nuclear geyser continues to produce further advanced building blocks of life ( until 2.0Ga) to create Eukaryote, then stopped by half life of U decay.
- After the emergence of super-continent, new site of much more evolved building blocks of life (metazoan and plant) appeared, it is a continental rift where atomic bomb magma erupts to promote mutations, 100 times faster evolution . Principle of life evolution is radiation same since its birth.

# Stroeis about birth place of life

On primordial continent

Birth place of life

primordial atmosphere

lakes with pure water

Mars

Earth

Pnaspermia

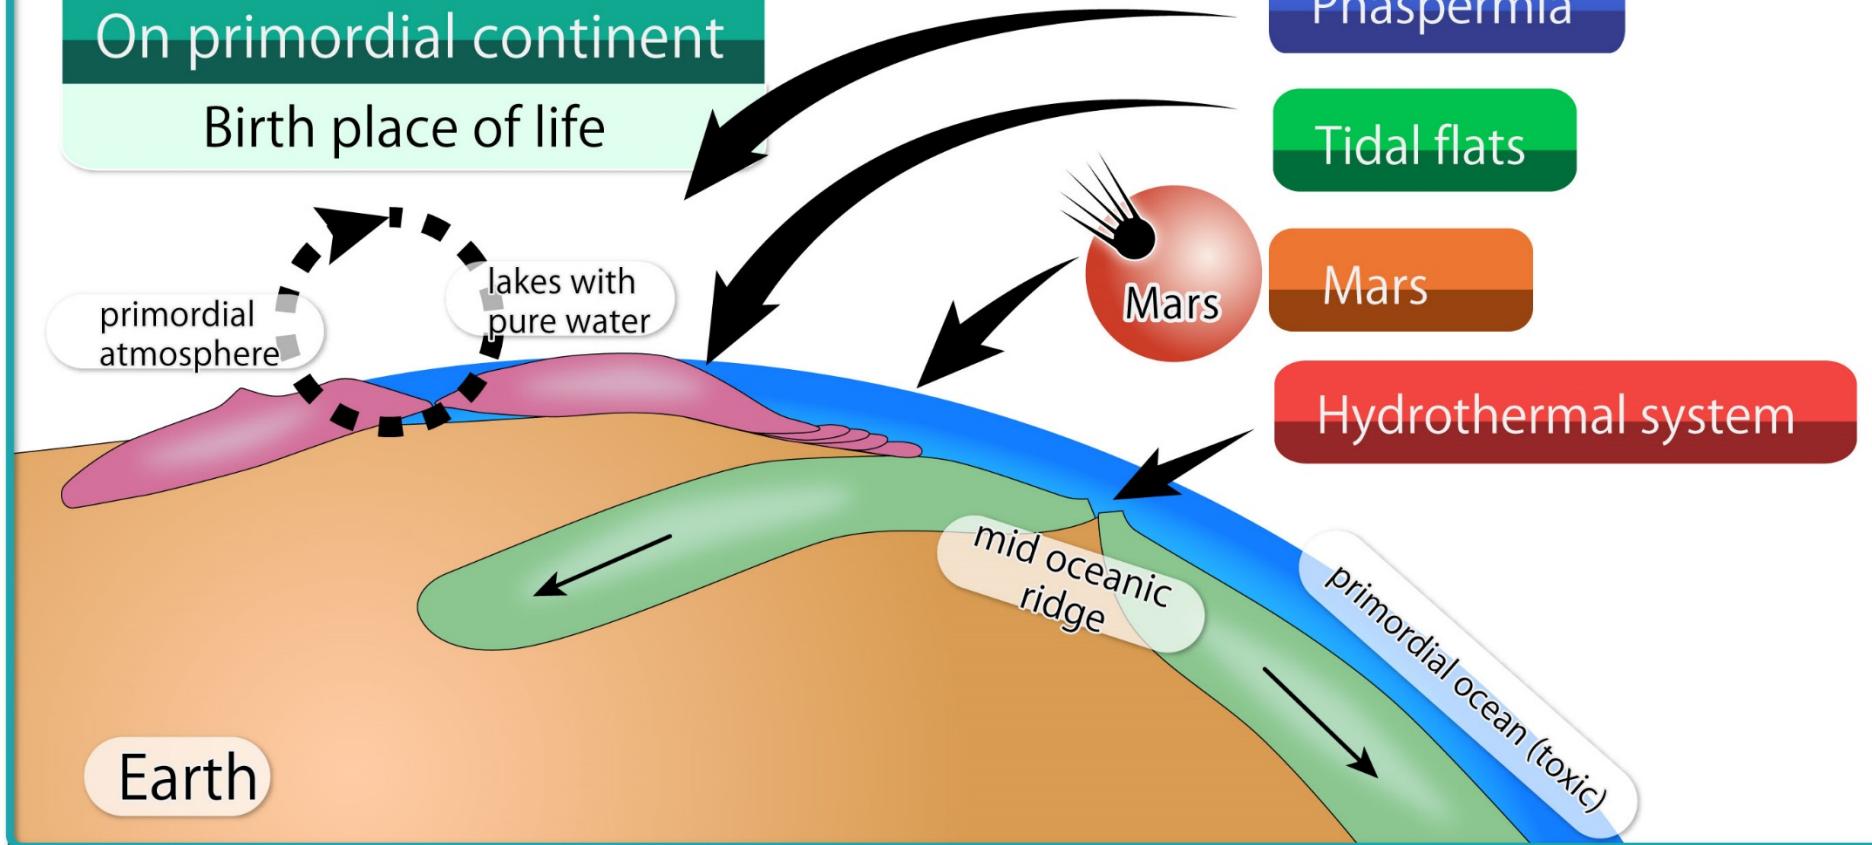

Tidal flats

Mars

Hydrothermal system

mid oceanic ridge

primordial ocean (toxic)

# Clear the condition for the emergence of life

## Where is the birth place?

生命の誕生場としての条件をクリアできるか

	Environmental factors 環境的要素	On primordial continent 原始大陸上説	Hydrothermal system 中央海嶺熱水系説	Mars 火星説	Universe 宇宙説
1	Energy source (ionizing radiation+ thermal energy) エネルギー源（電離放射線+熱エネルギー）	○	×	○	?
2	Supply of nutrients (P,K, KREEP etc) 栄養塩供給	○	×	○	×
3	Supply of enough nitrogen 十分な量の窒素供給	○	×	○	×
4	Life constituent elements 生命構成主要元素(CHON)	○	△	○	○
5	Concentration of reducing gas 還元的気体の高濃度化	○	×	?	×
6	Dry/wet cycle 乾湿反復環境	○	×	?	×
7	Non-toxic water environment 猛毒ではない水環境	○	×	?	×
8	Na poor water 水のK/Na比 (Naが少ない水)	○	×	○	×
9	Diversified environments (Ocean: pH, salinity, heavy metals, Atmosphere: T& P, Continent: varied geology) 多様な環境（海洋：pH、 塩分濃度、 重金属元素、 大気： 温度、 壓力、 大陸： 多様な地質と鉱物）	○	×	?	×

Mars kept ocean for the first 400million years after the formation  
 Universe does not have liquid water in the matrix  
 火星：最初の4億年しか海洋がなかった  
 宇宙：マトリックスに液体の水がない

# Conclusions

- 1 Birth place of life at mid-oceanic ridge has already been collapsed (Falsifiability)
- 2 Panspermia origin: a fantasy. Life is a phenomenon as biosphere (subsystem) in the Earth system back to its origin. Hence its transportation to the Earth must have been Ecosystem transportation. The Earth must have waited to accept it just as evolved to adjust rapidly evolving environment for the evolving ecosystem. Virtually impossible.
- 3 Birth place of life was not ocean, geyser system in a lake on the primordial continent.

# 6. Next strategy

1) Reproductive experiments with nuclear reactor to demonstrate the working hypothesis

原子炉で再現実験

Strategy: Tissues (membrane, cell all, double spiral etc) and processes (self-replication, sodium pump etc) record previous evolutional process. 組織とプロセスは環境化石

● Bottom up group (Reproductive experiments for prebiotic chemical evolution)

前駆的化学進化の再現

input: N<sub>2</sub>, CO<sub>2</sub>, H<sub>2</sub>O, KREEP, Anorthosite, catalytic minerals, 30 kinds of ribosome etc

→ monitor the reaction process and identify produced materials

● Top down group (monitoring the reaction of modern species) 現生生物の反応を観察

input: OD1, bacillus subtilis, hepatitis virus etc OD1微生物, 枯草菌、肝炎ウイルスなど

→ monitor the reaction process and identify produced materials

● Survival in toxic ocean

2) Numerical simulation of prebiotic chemical evolution based on laboratory experiments

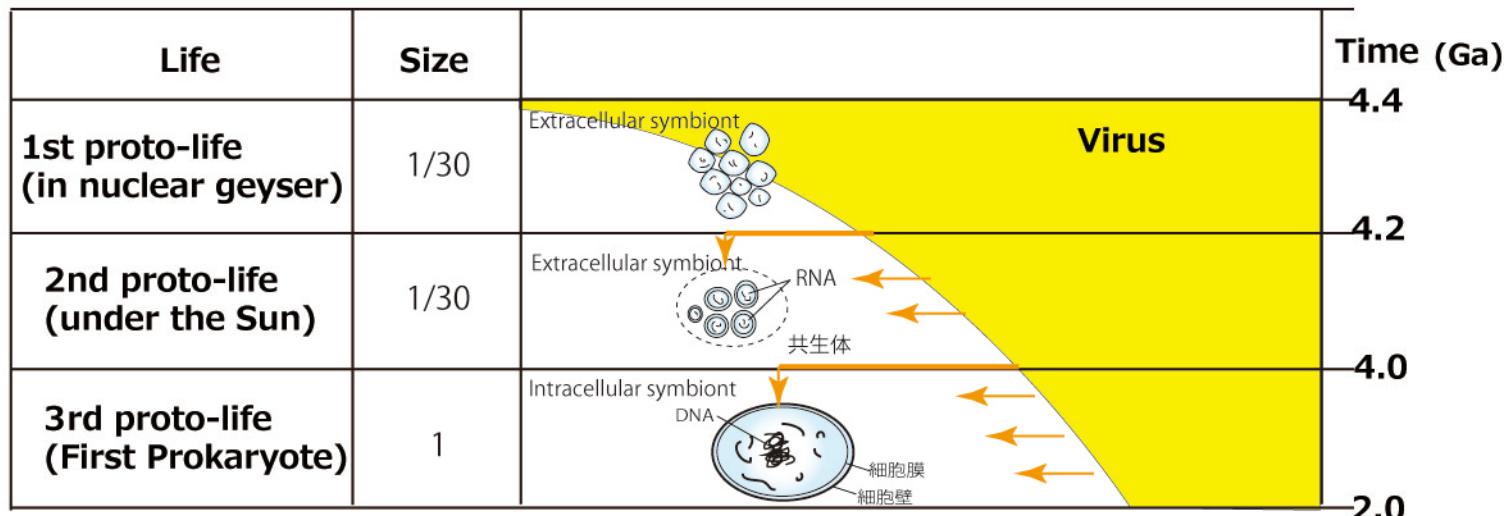

under the condition of changing pH, salinity, abundance of heavy metals and pO<sub>2</sub> and catalytic minerals.

3) Falsifiability + Upgrading of working hypothesis 反証可能性によって作業仮説を検証

→ We will be able to reach the truth of complexity science 複雑系科学の真実に限りなく近づく

End

# Step to the emergence of first life

**TABLE 11.1** The Differing Evolutionary Parameter Spaces Occupied by RNA and DNA Viruses<sup>a</sup>

Characteristic	RNA (and ssDNA) viruses	dsDNA viruses
Mutation rate (per nt)	High	Low
Genome size	Small (<32,000 nt)	Can be large (>100,000 nt)
Population sizes	Usually large	Can be small
Recombination	Often low rates	Often high rates
Epistasis	Antagonistic	Synergistic <sup>b</sup>
Gene duplication	Apparently rare	Common
Lateral gene transfer	Apparently rare	Common
Overlapping reading frames	Common	Relatively rare

dsDNA, double-stranded DNA; ssDNA, single-stranded DNA.

<sup>a</sup>Note that the properties shown are “average” ones, and cannot be applied to every taxon in each category (particularly for DNA-based organisms).

<sup>b</sup>By inference only: the extent and sign of epistasis has not been measured in dsDNA viruses.

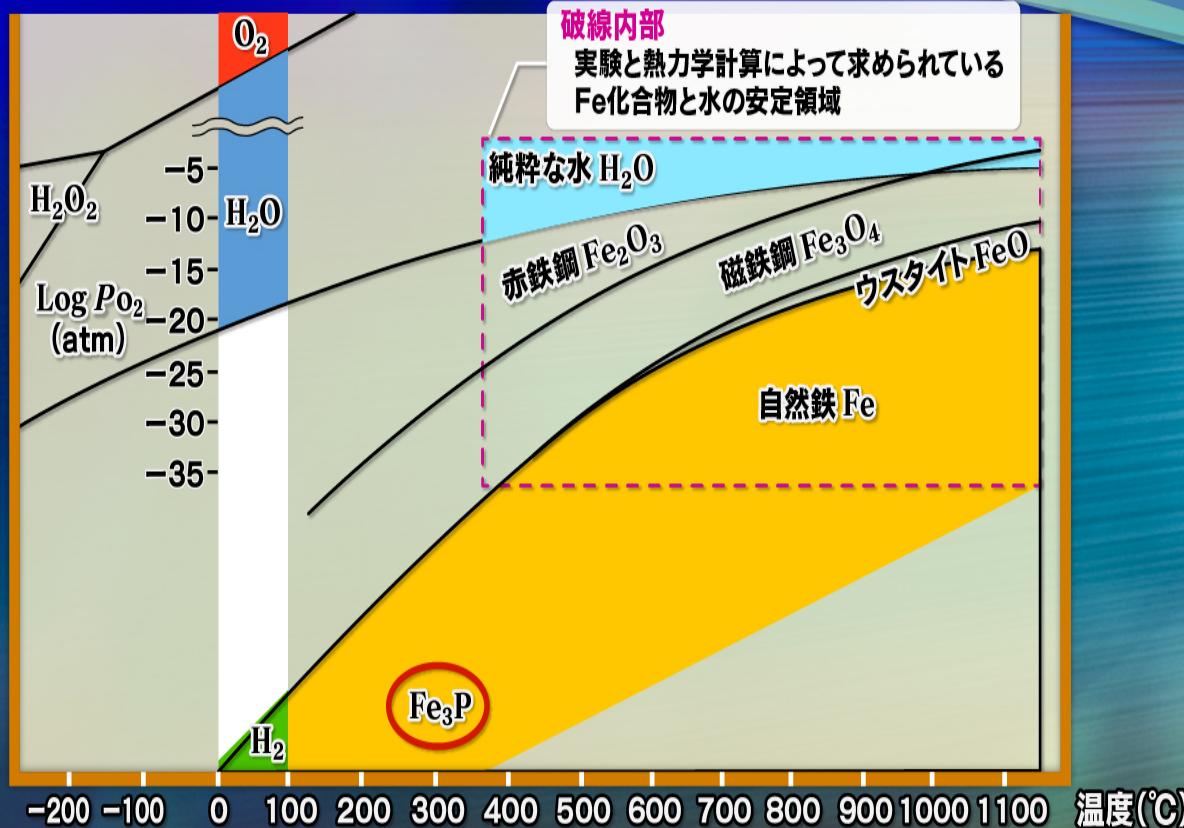

Holmes (2013)

Holmes (2013)

**FIGURE 11.12. Distribution of genome sizes in RNA and DNA viruses.** Note the similarity in (small) genome sizes between RNA viruses, retroviruses, and single-stranded DNA (ssDNA) viruses.

# Universe is full of life A fantasy of life and its evolution

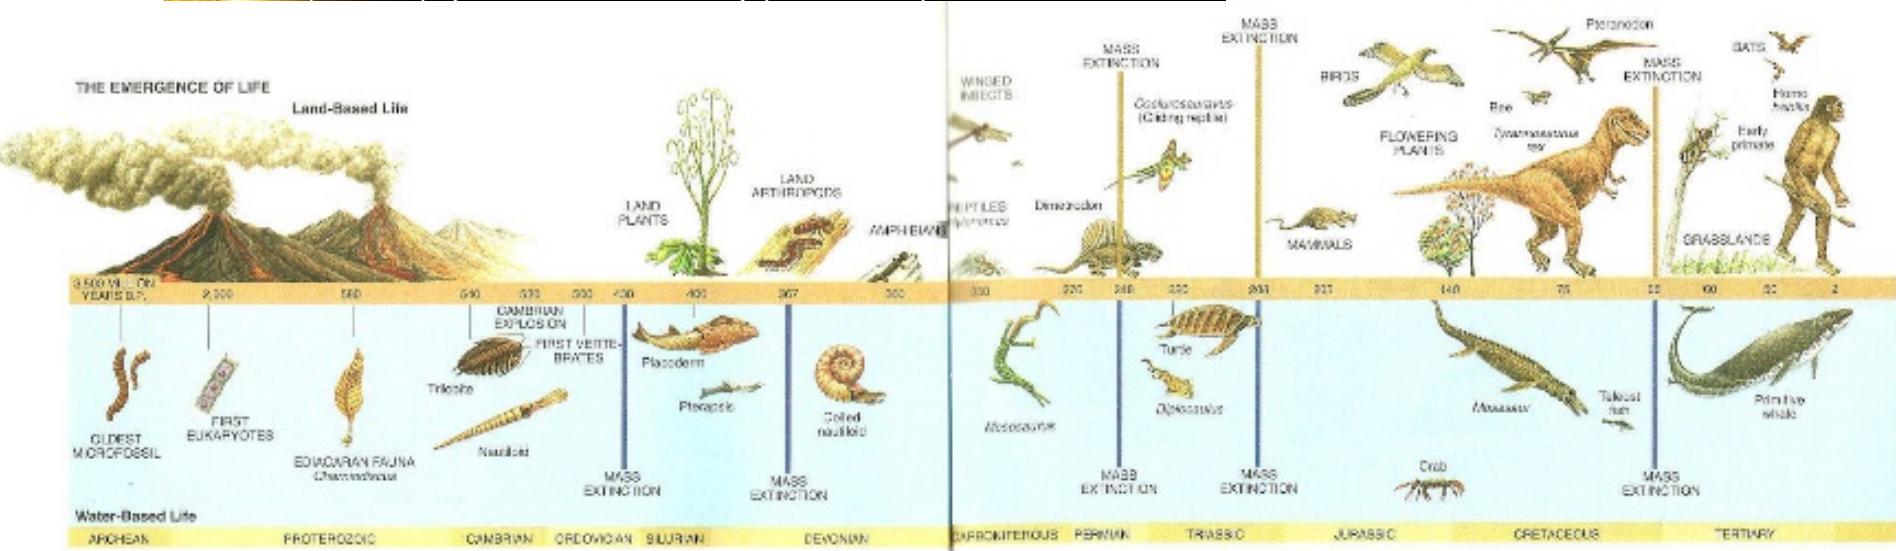

1) Molecular cloud

2) Formation of disk and central star

3) Formation of planets

Presence of liquid water does not mean the birth of life

# Step to begin and evolve life

Life	Size		Time (Ga)
<b>1st proto-life (in nuclear geyser)</b>	1/30	Extracellular symbiont	4.4
<b>2nd proto-life (under the Sun)</b>	1/30	Extracellular symbiont RNA 共生体	4.2
<b>3rd proto-life (First Prokaryote)</b>	1	Intracellular symbiont DNA 細胞膜 細胞壁	4.0
<b>Eukaryote</b>	$10^6$	Intracellular symbiont ゴルジ体 小胞体 核 リボソーム 液泡 動物細胞 植物細胞	2.0
<b>Metazoan Plant</b>	$10^{12}$	多生物共生体 口 脳の進化 お口せ	7
<b>Human being</b>	$10^{12}$	脳の進化	present

The diagram illustrates the evolution of life across six stages, each represented by a horizontal bar indicating its duration and a vertical bar indicating its size. The stages are color-coded: yellow for the first three stages (proto-life), light blue for the fourth stage (Eukaryote), light green for the fifth stage (Metazoan/Plant), and light purple for the sixth stage (Human being). The timeline is marked with major events: the appearance of viruses at 4.4 Ga, the transition to the second proto-life at 4.2 Ga, the emergence of the first prokaryote at 4.0 Ga, the development of eukaryotes at 2.0 Ga, the formation of metazoans and plants at 7 Ga, and the arrival of humans at the present time.

**1st proto-life (in nuclear geyser):** Represented by a yellow bar. The size is 1/30. The diagram shows a cluster of small, irregular shapes labeled "Extracellular symbiont".

**2nd proto-life (under the Sun):** Represented by a yellow bar. The size is 1/30. The diagram shows a cluster of small, circular shapes labeled "Extracellular symbiont" and "RNA", with a dashed line enclosing them and the label "共生体" (Symbiont).

**3rd proto-life (First Prokaryote):** Represented by a yellow bar. The size is 1. The diagram shows a single large oval cell labeled "Intracellular symbiont" and "DNA". Labels in Japanese include "細胞膜" (Cell membrane) and "細胞壁" (Cell wall).

**Eukaryote:** Represented by a light blue bar. The size is  $10^6$ . The diagram shows two types of cells: an animal cell and a plant cell. The animal cell contains organelles labeled "ゴルジ体" (Golgi apparatus), "小胞体" (Cytoskeleton), "核" (Nucleus), and "リボソーム" (Ribosomes). The plant cell contains "ミトコンドリア" (Mitochondria), "小胞体" (Cytoskeleton), "核" (Nucleus), and "葉緑体" (Chloroplasts). Labels in Japanese include "動物細胞" (Animal cell) and "植物細胞" (Plant cell).

**Metazoan Plant:** Represented by a light green bar. The size is  $10^{12}$ . The diagram shows a complex multi-cellular organism with various organs and systems. Labels in Japanese include "多生物共生体" (Multi-cellular symbiosis), "口" (Mouth), "脳の進化" (Brain evolution), and "お口せ" (Ookuse).

**Human being:** Represented by a light purple bar. The size is  $10^{12}$ . The diagram shows a timeline of human evolution from early hominids to modern humans, with the label "脳の進化" (Brain evolution) above the figures. To the right is a portrait of a man.

# 科学哲学：反証可能性 (Falsifiability)

# 反証可能性(Carl Popper)

- ①モデル(仮説)を実証することは不可能だが、モデル(仮説)を1つの観察や実験で葬り去ることができる。複雑系の科学(宇宙からゲノムまで)は、この論理を使って発展してきた。新たな観察や実験を説明できる新たな仮説を提案すればよい。
- ②例えば、戎崎Gのタンデムモデルは小惑星帯の年代学(+地質学)で殺すことが可能

# 俯瞰科学の重要性

# ハビタブルプラネットに進化するための条件

# 生命惑星誕生のための条件

## 第1グループ

- ① 中心星の化学組成と大きさ
- ② 円軌道を持つ
- ③ 惑星のサイズ (火星より大きくスーパーアースより小さい)
- ④ 衛星を持つ
- ⑤ 自転軸が傾斜している
- ⑥ 惑星の2段階形成 (ABELモデル)
- ⑦ Fe<sub>3</sub>Pが存在する
- ⑧ 適当な量の生命構成元素の付加
- ⑨ 適当な量の原始大気
- ⑩ 適当な量の窒素

- ⑪ 液体の水の存在領域内に惑星が位置する
- ⑫ Habitable Trinity条件を満たす
- ⑬ 適当な量の初期海洋質量
- ⑭ プレートテクトニクスの開始
- ⑮ 海洋の浄化が進む
- ⑯ 大気中のCO<sub>2</sub>の減少
- ⑰ 生命構成元素の消費時間
- ⑱ 構造浸食の度合い
- ⑲ ハビタブルトリニティ環境の維持時間
- ⑳ 彗星落下の阻止 (巨大ガス惑星の存在)

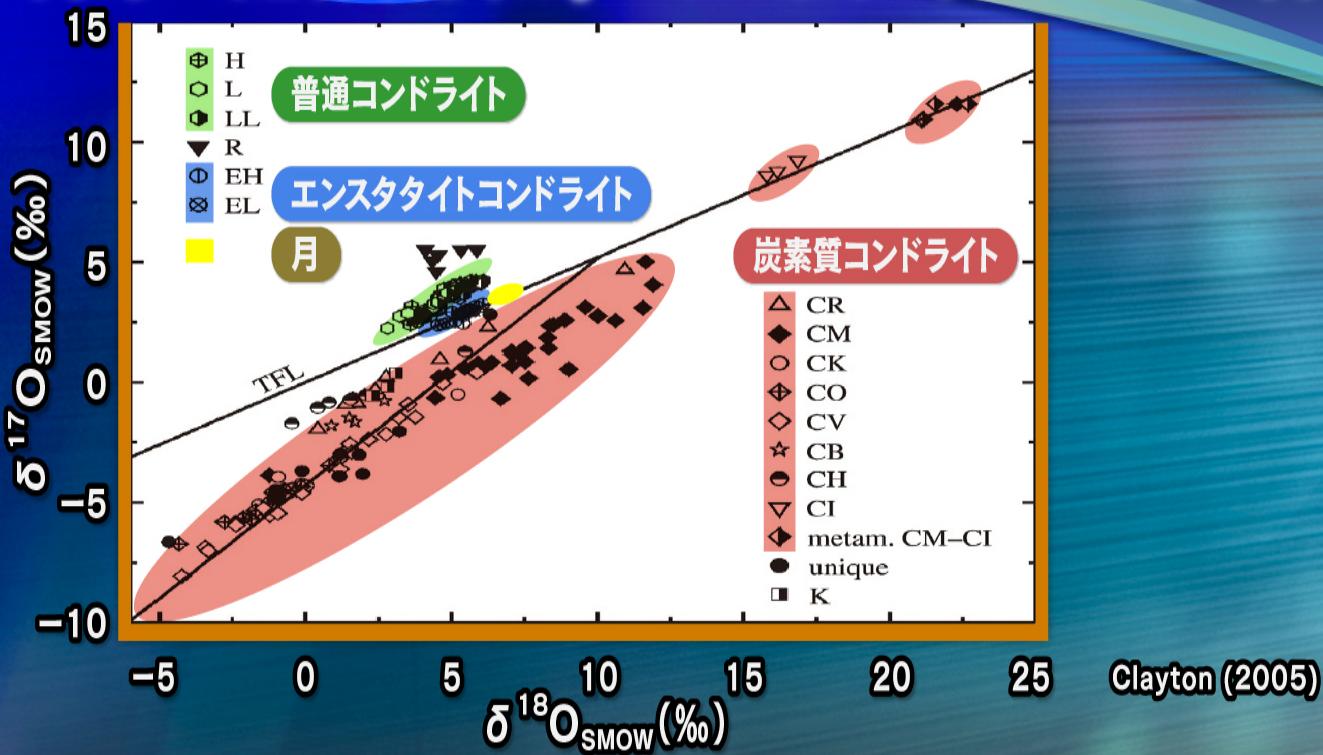

## 第2グループ

- ① 花こう岩質巨大陸地の存在
- ② 強い磁場の形成
- ③ 海水のマントルへの逆流の開始時刻
- ④ 生命進化の加速1 (宇宙:大量絶滅)
- ⑤ 生命進化の加速2 (リフト:HiRマグマ)
- ⑥ 後生動物への進化
- ⑦ オゾン層の形成
- ⑧ 生命構成元素の寿命

## 第3グループ

- ① 脊椎動物への進化
- ② 哺乳類への進化
- ③ 靈長類への進化
- ④ ホモサピエンスへの進化
- ⑤ 脳の発達
- ⑥ 生命構成元素の寿命

# 6 新しい惑星形成論

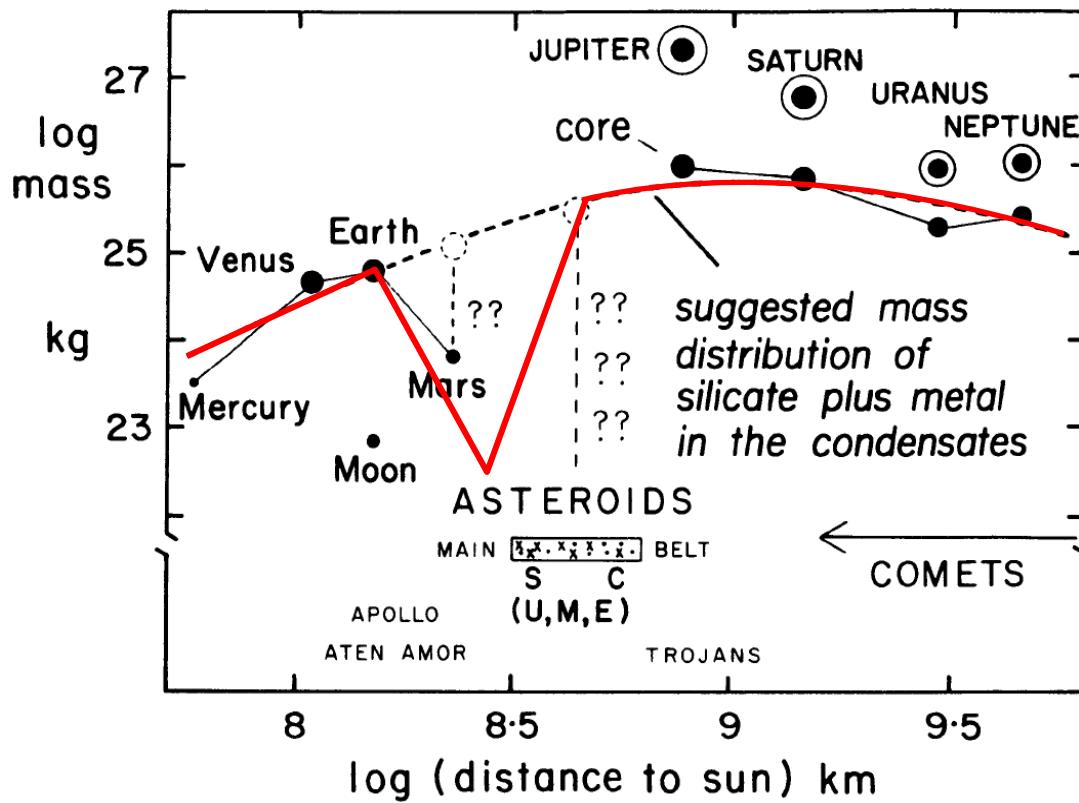

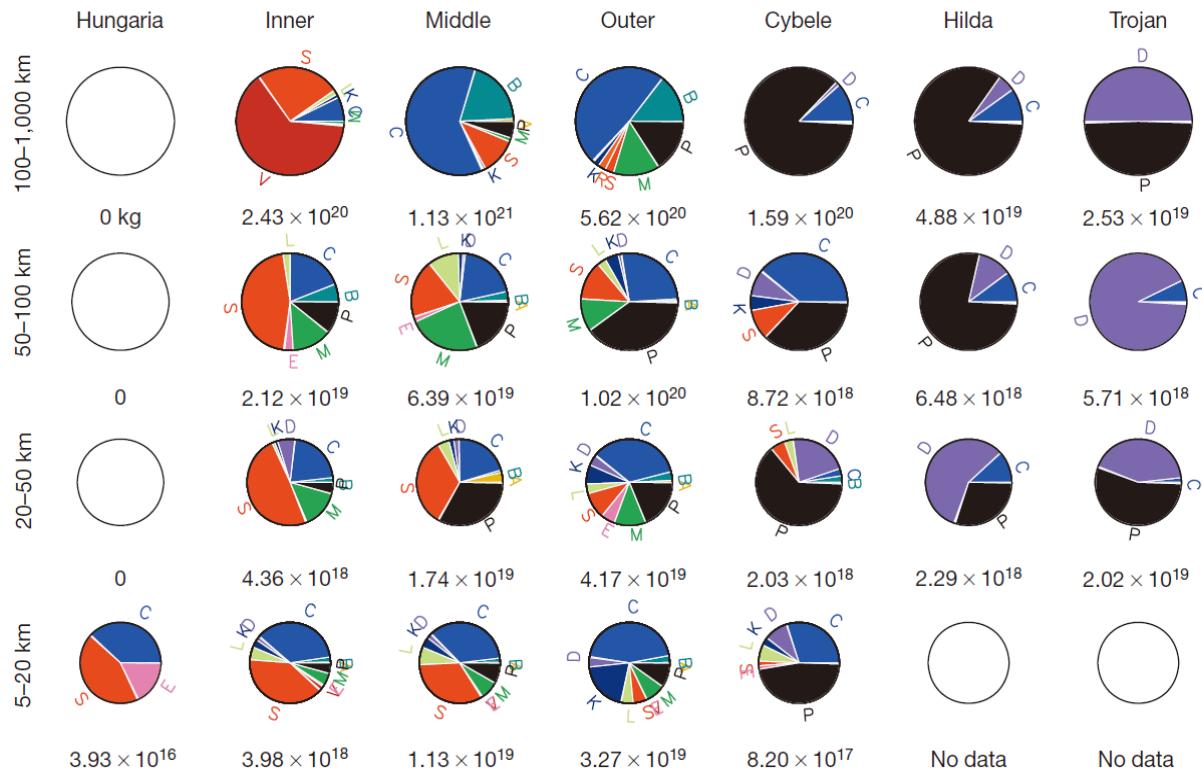

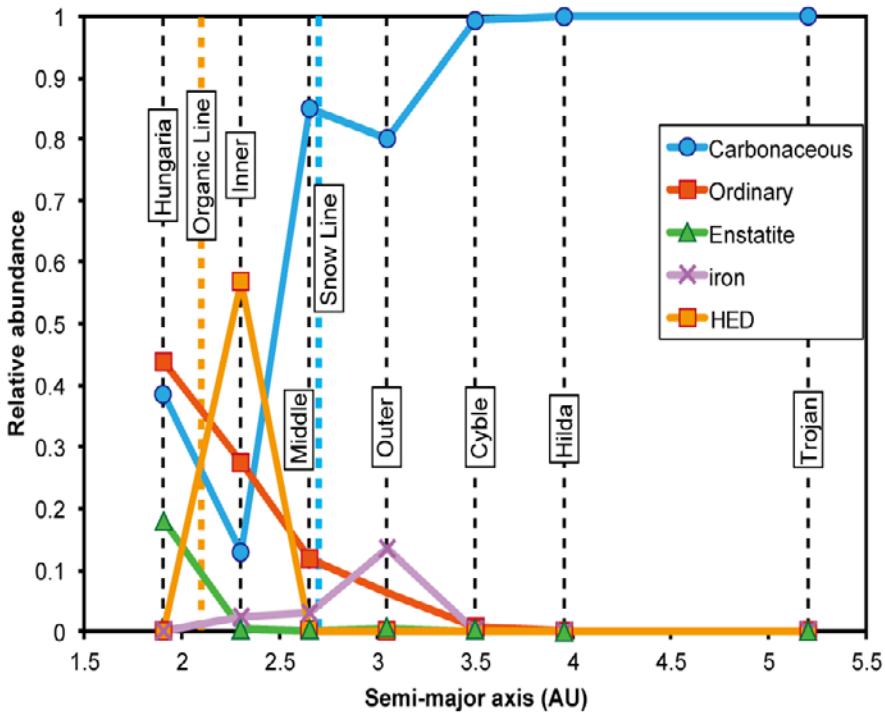

FIG. 6.—Mass-position diagram of solar system. The masses of the silicate-metal cores of the giant planets are taken from Hubbard and MacFarlane (1980), Gehrels (1976) and Slattery (1977). Note that the suggested mass distribution is shown in this way merely to give a pictorial comparison with the planets, and that the volume of each planetary zone must be taken into account (Weidenschilling 1978).

Smith (1982)

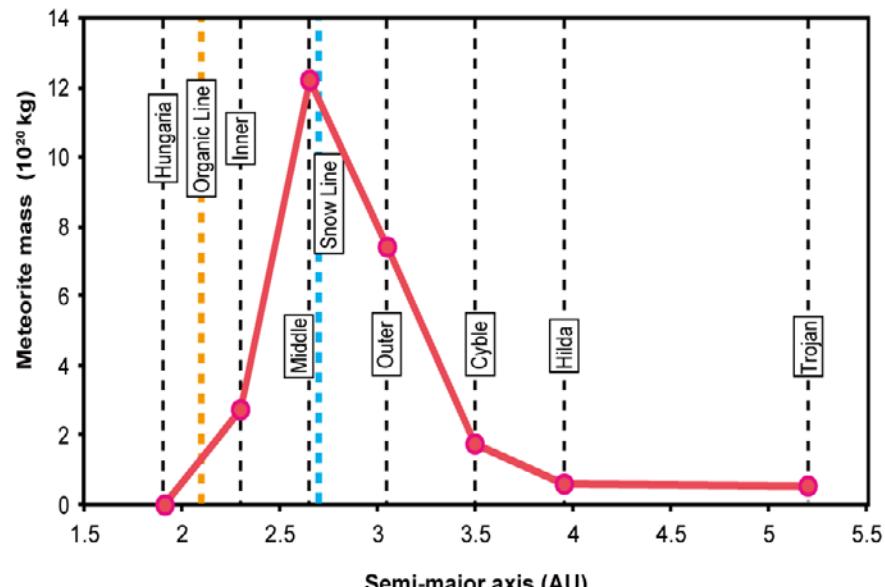

**Figure 4 | The compositional mass distribution as a function of size throughout the main belt out to the Trojans.** The mass is calculated for each individual object with a diameter of 50 km and greater, using its albedo to determine size and the average density<sup>39</sup> for that asteroid's taxonomic class. For the smaller sizes we determine the fractional contribution of each class at each size and semi-major axis, and then apply that fraction to the distribution of all known asteroids from the Minor Planet Center (<http://minorplanetcenter.org/>) including a correction for discovery incompleteness at the smallest sizes in the

middle and outer belt<sup>19</sup>. Asteroid mass is grouped according to objects within four size ranges, with diameters of 100–1,000 km, 50–100 km, 20–50 km and 5–20 km. Seven zones are defined as in Fig. 1: Hungaria, inner belt, middle belt, outer belt, Cybele, Hilda and Trojan. The total mass of each zone at each size is labelled and the pie charts mark the fractional mass contribution of each unique spectral class of asteroid. The total mass of Hildas and Trojans are underestimated because of discovery incompleteness. The relative contribution of each class changes with both size and distance.

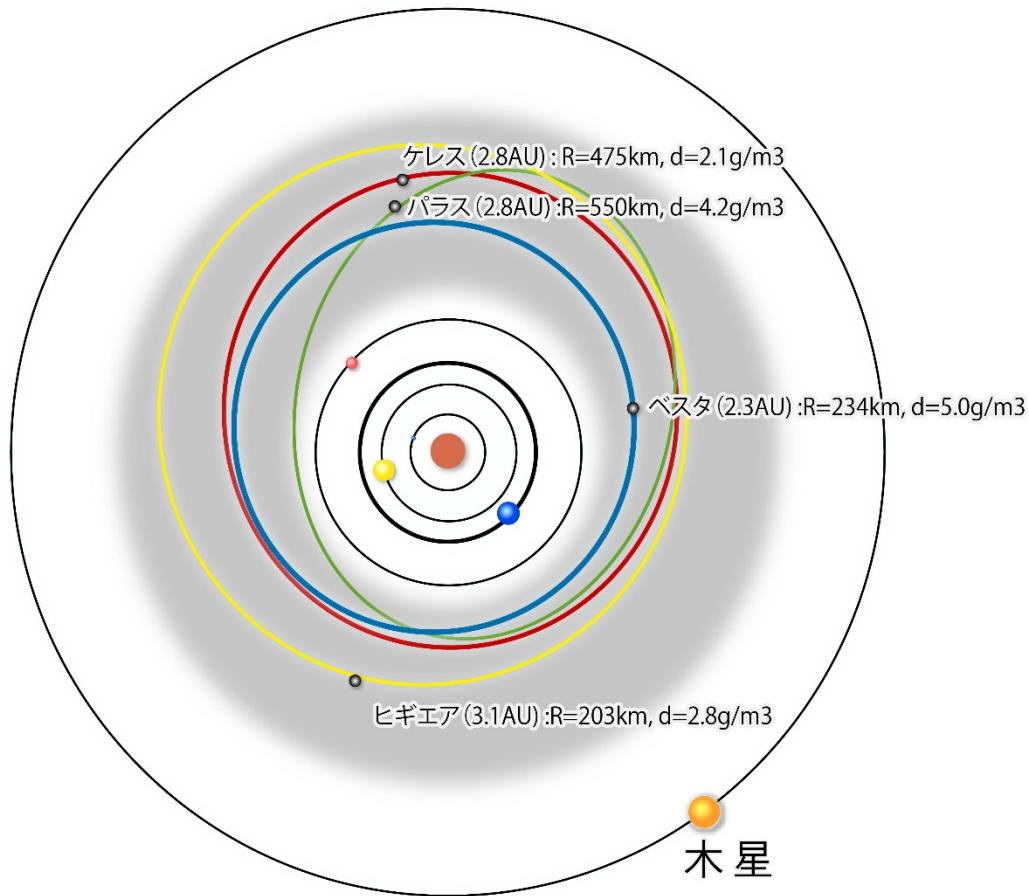

- **Chemical zoning in the asteroid belt**
- Carry, 2010とDeMeo et al., 2012から
- 作成した各小惑星を隕石と対応させて作成した図。
- アステロイドベルト中の各隕石の存在比を示す
- Enstatiteは2.5AUより内側で存在する。
- 炭素質コンドライトは主に2.5AUより外側に存在する。

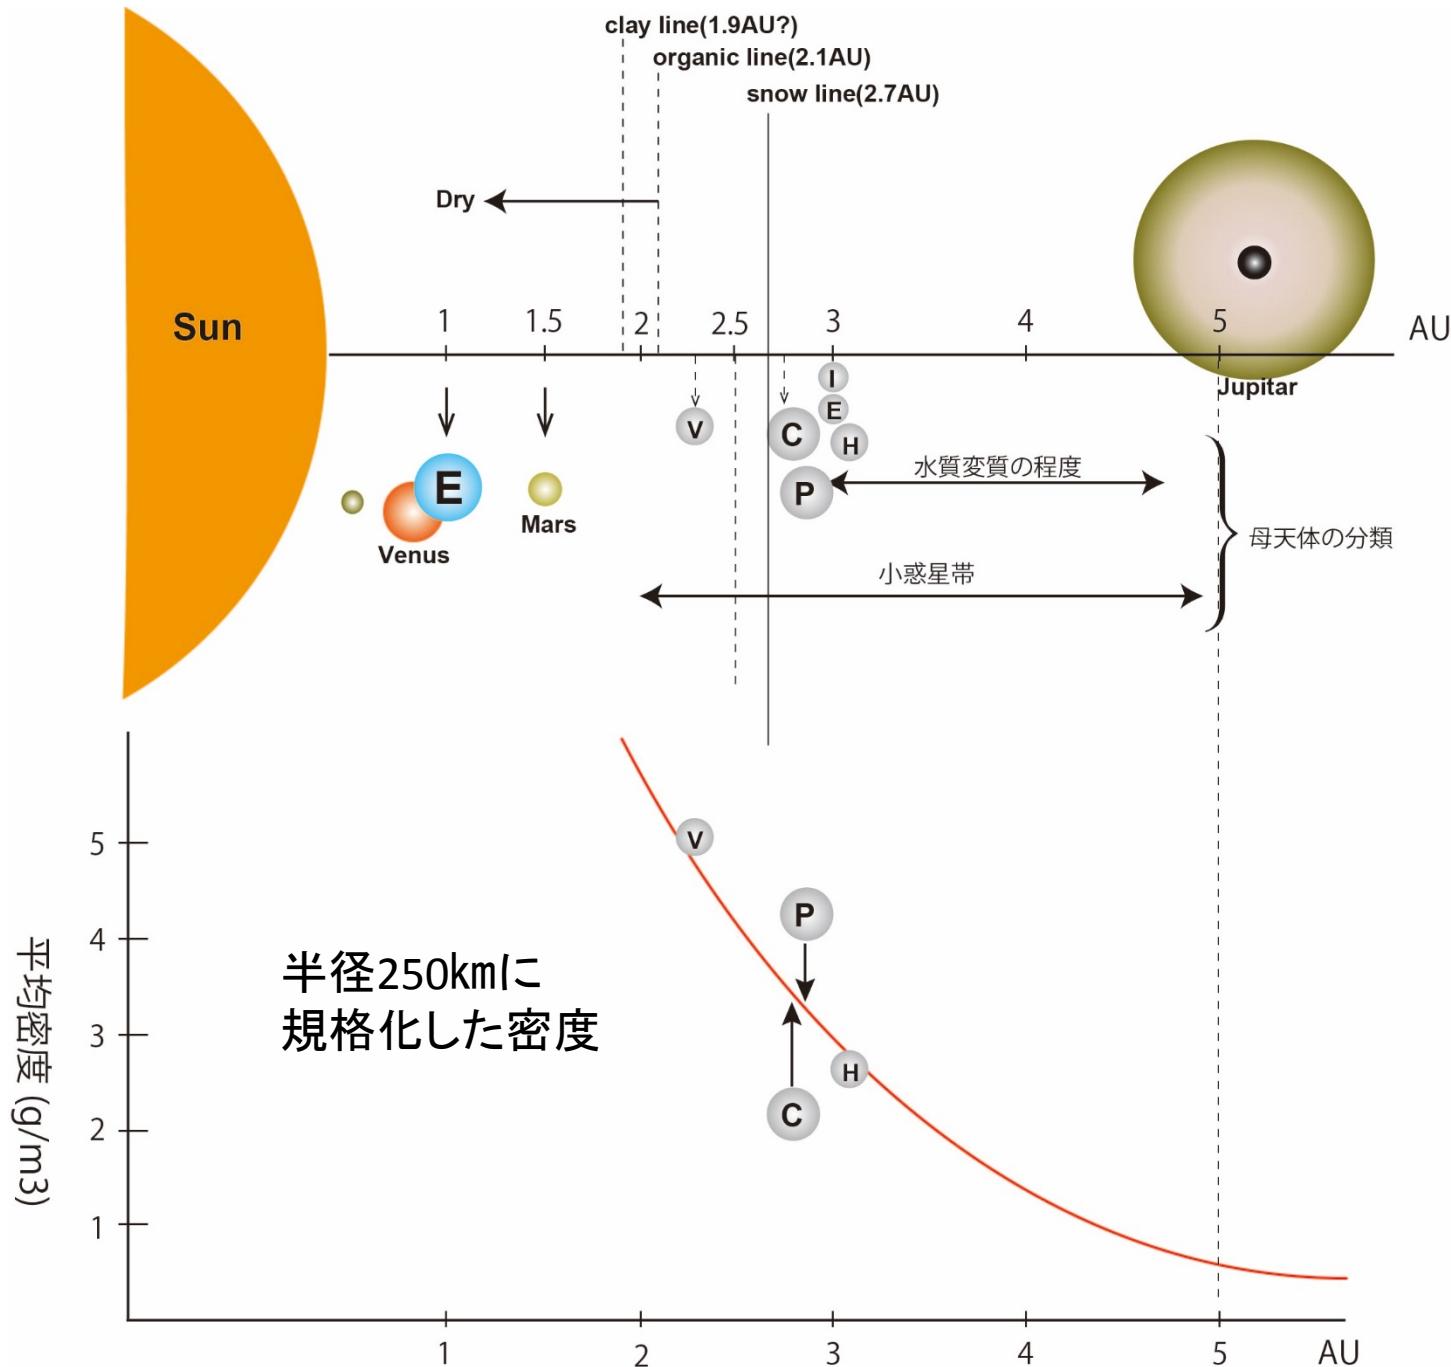

Primary asteroids must be circular orbits not have been disturbed by Jupiter, and those preserve the compositional change of chemistry.

## 小惑星帯の小惑星( $R > 200\text{km}$ )

小惑星	半径	軌道長半径	密度	離心率	近日点距離	遠日点距離
ベスタ	234km	2.36AU	5.0	0.089	2.153AU	2.571AU
パラス	550km	2.77AU	4.2	0.231	2.132AU	3.413AU
ケレス	475km	2.77AU	2.1	0.076	2.558AU	2.978AU
ヒギエア	203km	3.14AU	2.8	0.117	2.773AU	3.507AU
